The proposed project is a modification to previously analyzed uses and would be processed as an Addendum to the Certified EIR, consistent with CEQA Guidelines Section 15164. The Addendum evaluates whether the proposed fuel station, to be developed in the northeastern portion of the Walmart Supercenter parking lot, would result in new or more severe environmental impacts compared to those disclosed in the Certified EIR.

2. PROJECT DESCRIPTION

2.1 PROJECT LOCATION

The project site is at 58501 Twentynine Palms Highway (SR-62) (APN 0601-201-54) in the Town of Yucca Valley (Town), San Bernardino County, California The project site encompasses 1.32 acres in the northeast portion of the existing Walmart Supercenter parking lot. The site is south of SR-62 and east of Avalon Avenue (see Figure 1, *Regional Location*, and Figure 2, *Local Vicinity*). The project site is bordered by ornamental landscaping and a paved drive aisle to the north and east, and by Walmart Supercenter parking to the south and west.

The Specific Plan area is approximately 10 miles west of the City of Twentynine Palms, 15 miles northeast of the City of Desert Hot Springs, and 17 miles northeast of the City Palm Springs. Joshua Tree National Park lies to the south and southeast of the Town. The project site is in the Yucca Valley North United States Geological Survey (USGS) 7.5-minute Quadrangle.

2.2 ENVIRONMENTAL SETTING

The project site is fully developed and surrounded by developed uses. It is developed with a paved commercial parking lot with ornamental landscaping on a Walmart Supercenter property (see Figure 3, *Aerial Photograph*). The project site has no natural or undisturbed areas, nor does it contain any unique topographic or biological features such as sensitive habitat, special-status species, or jurisdictional features (e.g., wetlands, streams, or other water bodies subject to federal or state regulatory authority). The nearest western Joshua tree is more than 60 feet from the project site, outside the area of disturbance.

The project site is designated in the General Plan as Commercial and is zoned as General Commercial under the Specific Plan. The surrounding area consists of commercial development along SR-62, with adjacent retail uses and associated parking areas to the east, south, and west. The nearest residential uses are approximately 0.12 mile north of the project site and north of SR-62. Surrounding land use designations include Medium High Density Residential to the north, Commercial to the east, Industrial to the south, and Commercial and Low Density Residential to the west, as identified in the Town's General Plan (Town of Yucca Valley 2022). Like the project site, property to the east and west is also zoned General Commercial, to the south as Industrial, and to the north as Residential, Multi-Family.

2.3 DESCRIPTION OF THE PROPOSED PROJECT

The proposed project is a new fuel station and convenience store in the northeastern portion of the existing Walmart Supercenter parking lot, consistent with the commercial land use vision established in the Specific Plan. The fuel station would include six fuel dispensers (with 12 fueling positions) beneath a canopy, a 1,556-square-foot convenience store that would include alcohol sales and an air station. A total of 135 parking spaces would be removed, but 15 spaces would be installed at the convenience store. Three USTs would be installed on the site: one 20,000-gallon gasoline tank, one 20,000-gallon gasoline split tank[2], and one 20,000-gallon diesel tank. A total of 771 parking spaces (inclusive of the 15 spaces at the fuel station/convenience store) would still be available for the Walmart Supercenter, which is 28 more spaces than required by the Town.

The proposed project would include new drive aisles for internal circulation, new landscaped areas in the parking lot and in median along the west side of the project site and the re-landscaping of an existing landscaped median on the north side of the project site (see Figure 4, *Site Plan*). A new pedestrian walkway would connect the project site to an existing bus stop area to the northwest, improving pedestrian access to public facilities. The proposed project would require excavation up to 25 feet below grade to install the underground tanks and associated utilities (see Figure 4).

The proposed project would connect to existing utility infrastructure that serves the Walmart Supercenter property, including water, wastewater, electricity, and telecommunications. As part of project development, existing underground utilities within the project footprint would be relocated or adjusted as needed to accommodate the fuel station and associated improvements. No off-site (outside of the Walmart Supercenter property) utility extensions or relocations are proposed. The site would be graded to direct surface runoff to a new on-site underground detention system equipped with a hydrodynamic separator and media filtration unit. This stormwater system is designed to capture and treat runoff prior to discharge, consistent with requirements under the Phase II Small MS4 General Permit and Town of Yucca Valley standards. These stormwater controls constitute the project's low-impact development (LID) features and include pretreatment of runoff from fuel areas, detention on-site, diversion of runoff from impervious areas to landscaped areas where feasible, and preservation of existing drainage patterns. The system would also ensure compliance with post-construction stormwater management requirements.

[2] The 20,000-gallon split gasoline tank would hold 12,000 gallons of regular gasoline and 8,000 gallons of premium gasoline, respectively.

Site Plan

This page is intentionally left blank.

2.3.1 Construction and Operation

Construction of the proposed project is anticipated to begin in 2026 and would be completed over 12 to 18 months. Construction activities would include site preparation, grading, construction, and trenching for underground utilities; installation of fuel infrastructure and USTs; construction of the convenience store building; and installation of landscaping and other site improvements. Excavation of up to 25 feet below grade would be required for the installation of underground fuel tanks and associated utility infrastructure. Construction activities would comply with applicable Town standards and state and federal regulatory requirements.

Following construction, the fuel station and convenience store would operate 24 hours a day, seven days a week, generally consistent with the hours of the Walmart Supercenter. The facility would employ approximately six employees across three shifts. The convenience store would offer typical retail goods, alcohol sales, and an air station for vehicle tire inflation. Fuel deliveries, anticipated once or twice per week, would be by licensed tanker trucks in compliance with applicable environmental and safety regulations.

Customer access to the fuel station would be primarily via existing Walmart drive aisles. The proposed internal circulation layout is designed to maintain efficient traffic flow in the parking lot and ensure safe vehicular and pedestrian access to both the fuel station and the Walmart Supercenter.

2.3.2 Lead Agency and Responsible Agency Approvals

LEAD AGENCY

The Town of Yucca Valley is the lead agency under CEQA and has primary responsibility for reviewing and approving the proposed project. Discretionary approvals required from the Town include:

- Approval of a Specific Plan Amendment to include the proposed project (i.e. a fuel station) in the Specific Plan.
- Approval of a Conditional Use Permit (CUP) for the construction and operation of a fuel station and associated convenience store, pursuant to Dev. Code 9.06.030(A)(1)(b).

REQUIRED PERMITS AND APPROVALS

In addition to the Town approvals, the proposed project is subject to review, approval, or permitting by other agencies, including:

- **San Bernardino County Department of Environmental Health.** Issuance of permits related to USTs for fuel storage and compliance with applicable health and safety regulations.
- **Colorado River Basin Regional Water Quality Control Board (Region 7).** Compliance with water quality regulations, including coverage under the State Water Resources Control Board's Phase II Small Municipal Separate Storm Sewer System (MS4) General Permit and Construction General Permit.
- **Mojave Desert Air Quality Management District.** Issuance of a permit to operate the fuel dispensing facilities and associated equipment for stationary emission sources.

The environmental review for the proposed project considers the potential impacts associated with these discretionary and ministerial approvals. Coordination with applicable agencies would occur throughout the entitlement and permitting process to ensure compliance with all applicable state, regional, and local regulatory requirements.

RELATED REVIEW AND CONSULTATION REQUIREMENTS

Senate Bill 18. In accordance with California Government Code Section 65352.3 (Senate Bill [SB] 18), the proposed project is subject to tribal consultation requirements due to the proposed Specific Plan Amendment. SB 18 requires local governments to contact and offer to consult with California Native American tribes that are traditionally and culturally affiliated with the project area prior to the adoption or amendment of a general plan, specific plan, or related planning policy.

As the lead agency, the Town of Yucca Valley notified tribes identified by the NAHC as being traditionally affiliated with the project area. The tribes were first notified about the proposed project in February 2025. Formal invitations to consult were sent on July 21, 2025, and July 25, 2025, offering tribal governments the opportunity to participate in consultation regarding the proposed Specific Plan Amendment and associated discretionary actions. Tribes that identify traditional cultural places, sacred sites, or other tribal cultural resources within or near the project site have the opportunity to consult with the Town to determine appropriate measures for avoidance, preservation, or mitigation in accordance with SB 18. The following tribes requested consultation under SB 18:

- The Twenty-nine Palms Band of Mission Indians responded on March 10, 2025, requesting formal consultation under SB 18. The Town met with the Tribe on July 10, 2025.

- The Morongo Band of Mission Indians responded on March 27, 2025, requesting formal consultation under SB 18. The Town provided a draft version of this Addendum to the Tribe and received no response or comments.

- The Yuhaaviatam of San Manuel Nation responded on August 5, 2025, confirming formal consultation is not required, and shared recommended mitigation measures.

- The Agua Caliente Band of Cahuilla Indians responded on August 5, 2025, requesting formal consultation under SB 18. The Town met with the Tribe on August 6, 2025, and the Tribe subsequently followed up after the meeting via email requesting the presence of an approved cultural resource monitor or monitors from a consulting tribe during any ground-disturbing activities. The Tribe responded on December 8, 2025, concurring with the Town's determination at this time. They noting that the project site lies within the Tribe's Traditional Use Area and stated that cultural monitoring is deferred to the San Manuel and Morongo tribes.

This page intentionally left blank.

3. ENVIRONMENTAL ANALYSIS

The section summarizes the conclusions of the Certified EIR and then discusses how the proposed project would meet the conditions described in CEQA Guidelines Section 15164 for preparation of an Addendum. Mitigation measures referenced are from the Certified EIR and are modified as appropriate.

3.1 AESTHETICS

3.1.1 Summary of Impacts Identified in the Approved Project

- **Scenic Vista**. Because vistas of the mountains surrounding the project site would not be completely blocked, the architectural features of the approved project are complementary to the desert setting, and the elevation of the site is low lying in comparison to some of the nearby roads, the Certified EIR identified that the approved project would have a less than significant effect on a scenic vista.

- **Scenic Resources in a State Scenic Highway**. According to the Certified EIR, there are no State-designated scenic highways in the Town of Yucca Valley. SR-62 is an eligible State Scenic Highway and is also designated as a local scenic highway and Joshua trees are considered a scenic resource in the Town. The Joshua Tree Survey and Salvage Plan (included in the Specific Plan) identified suitable areas for transplanting trees within the Specific Plan area and ensured compliance with Policy 6 of the Biological Resources Element and the Town of Yucca Valley Ordinance No. 140. Therefore, the Certified EIR identified a less than significant impact with respect to scenic resources (Joshua trees) within a State Scenic Highway.

- **Visual Character or Quality**. The Certified EIR identified that the approved project was consistent with existing development trends along SR-62, complied with the requirements of the Specific Plan, and was subject to review by the Town of Yucca Valley. Therefore, the Certified EIR determined that the approved project would not substantially degrade the existing visual character or quality of the site and its immediate surroundings, and its impacts were less than significant impact.

- **Light and Glare**. The Certified EIR identified that impacts associated with daytime glare were less than significant and that the approved project would not affect nighttime views from land uses to the north and west, as these uses are separated by roadways that already produce nighttime lighting and glare impacts. However, the Certified EIR identified that the approved project could create a potentially significant impact from spillover light at the

adjacent properties to the east and south. The Certified EIR included Mitigation Measures 4.1.1A, 4.1.1B, and 4.1.1C to reduce nighttime light and glare impacts to less than significant levels.

3.1.2 Impacts Associated with the Proposed Project

Except as provided in Public Resources Code Section 21099, would the project:	**Level of Impact in Certified EIR**	**Conditions Requiring Subsequent Review**			**Proposed Project Meets the Conditions for an Addendum** *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Have a substantial adverse effect on a scenic vista?	LTS	No	No	No	**Yes**
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	LTS	No	No	No	**Yes**
c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other	LTS	No	No	No	**Yes**

Except as provided in Public Resources Code Section 21099, would the project:	**Level of Impact in Certified EIR**	**Conditions Requiring Subsequent Review**			**Proposed Project Meets the Conditions for an Addendum** *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
regulations governing scenic quality?					
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	LTS/M	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation;
SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Have a substantial adverse effect on a scenic vista?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed in the Certified EIR, the Little San Bernardino Mountains and the Sawtooth Mountains are the dominant scenic vistas visible from the Town. The project site does not contain any scenic vistas, with the Little San Bernardino Mountains being the closest scenic vista, approximately 6 miles south of the project site.

Although the specific location and design of the proposed fueling facility differ from the original layout of the approved project's fuel station, the facility would be developed within the same general boundaries analyzed in the Certified EIR. The fuel station would remain generally consistent with the approved project as a six-pump fuel station with a canopy. The addition of a single-story, 1,556-square-foot convenience store would not alter the project's overall visual profile or introduce new features that obstruct views of the surrounding landscape.

Due to the distance, the proposed project site would not be distinguishable from the nearest scenic vista, the Little San Bernardino Mountains six miles to the south. In addition, the Walmart Supercenter (part of the approved project), Home Depot, and other commercial uses already obstruct distant eastern views of the surrounding mountains. The proposed project would not exceed a height of 40 feet, in compliance with the Town's Development Code, and would be similar in height to other commercial uses in the surrounding area. Therefore,

development of the single-story convenience store and fuel station would not significantly block any vista or viewpoint.

Architectural design, building materials, and landscaping would comply with the Specific Plan and Town design standards, which promote desert-compatible design and muted colors that minimize contrast with the surrounding landscape. Therefore, the proposed project would not result in a substantial adverse effect on a scenic vista. Visual impacts would remain similar to those identified in the Certified EIR and would continue to be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

A portion of State Route 247 (SR-247) approximately 4 miles northwest of the project site is the closest officially designated Scenic Highway (Caltrans 2025). SR-62, which bounds the project site to the north, is an eligible but not officially designated State Scenic Highway. The nearest western Joshua tree is more than 60 feet from the project site, outside the area of disturbance.. Therefore, no scenic resources such as trees, rock outcroppings, or historic buildings would be damaged or removed as a result of the proposed project. No new significant environmental effects would occur, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.
As defined by Public Resources Code Section 21071, for an incorporated city, an “urbanized area” is a city that either by itself or in combination with two contiguous incorporated cities has

a population of at least 100,000 persons. The Town of Yucca Valley has an estimated population of 22,027 people and is not contiguous with any towns or cities (DOF 2025). Therefore, the project site would be in a nonurbanized area.

The proposed project would be developed in similar size and height to surrounding commercial development. The proposed project would be similar in scale, design, and height to surrounding commercial uses and would not exceed the 40-foot height limit allowed under the General Commercial zoning designation, consistent with the approved project. The proposed project would be constructed in accordance with the Specific Plan, setback and height regulations, and applicable zoning standards. Therefore, the proposed project would not substantially degrade the existing visual character or quality of the site and its immediate surroundings, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would involve construction activities similar to, or less intensive than, those of the approved project. Temporary construction activities and lighting would be consistent with the assumptions of the approved project. Sources of light and glare during construction activities would be temporary and would not constitute a new source of substantial glare. Therefore, impacts from light and glare during construction would result in a less than significant impact.

Operational lighting and glare would be similar to the approved project, which includes internal lights emanating from the commercial development; security lighting; overhead fuel station lighting; and accent lighting on buildings and landscaping. The proposed project's parking and drive aisles along SR-62 would increase vehicles on-site in these areas. However, the addition of vehicles on the site along SR-62 would not introduce a substantial new source of light and glare since vehicles already travel along this roadway. Although the specific location and design of the proposed fueling facility differ from the original layout, light and glare impacts were previously analyzed by the approved project. Further, the addition of the convenience store would not introduce new sources of light and glare to the project site because the Walmart Supercenter and surrounding area includes internal sources of light and glare. However, to further minimize potential spillover lighting and glare, the proposed project would continue to implement Certified EIR Mitigation Measures 4.1.1B and 4.1.1C, which require the use of cut-off optics and

submittal of a photometric study to demonstrate that lighting does not extend onto adjacent properties. Compliance with these measures and the Town's lighting standards would ensure that light and glare impacts remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.1.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. Mitigation Measure 4.1.1.A was incorporated as part of the approved project and does not apply to the proposed project. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and <u>underline</u> for new, inserted text.

> ~~**4.1.1A** Pole-mounted floodlights at the main entry façade shall be fitted with glare shields or adjustable "barn doors" to control unwanted spill light.~~
>
> **4.1.1B** All exterior wall-mounted area lights on project buildings, the fast-food drive-through lane lights, and the fast-food restaurant parking lot lights shall be equipped with "cut-off" optics to mitigate spillover light and direct glare within the project boundary. Specifically, the Illumination Engineering Society (IES) definition for the cut-off fixture classification is as follows: Intensity at 80 degrees from nadir (0-degree-angle pointing directly downward from the lighting fixture) does not exceed 100 candela (cd) per 1000 lamp lumens, nor at 90 degrees from nadir does the intensity exceed 25 cd per 1,000 lamp lumens.
>
> **4.1.1C** Prior to the issuance of grading permits, the applicant shall submit to the Town a photometric study (to include parking areas and access way lights, external security lights, and lighted signage), proving that the project light sources do not spill over to adjacent off-site properties.

3.2 AGRICULTURE AND FORESTRY RESOURCES

3.2.1 Summary of Impacts Identified in the Approved Project

- **Conversion of Farmland**. The Certified EIR determined that development under the approved project would not result in the conversion of farmland to non-agricultural use. According to the Farmland Mapping and Monitoring Program, no portion of the Town of Yucca Valley, including the project site, is designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Therefore, the Certified EIR identified no impact related to farmland conversion.

- **Agricultural Zoning or Williamson Act Conflicts**. The Certified EIR identified that the project site is designated and zoned General Commercial (C-G) and is not subject to a Williamson Act contract. Development of the approved project would not conflict with any agricultural zoning or agricultural preserves. Therefore, the Certified EIR concluded that no impact would occur.

- **Forestry Resources.** The Certified EIR did not evaluate forestry resources, as this topic was not yet included in the CEQA Guidelines Appendix G checklist at the time the document was prepared. However, the project site and surrounding area are urbanized and do not contain forest land, timberland, or other related resources.

3.2.2 Impacts Associated with the Proposed Project

Would the Project:	**Level of Impact in Certified EIR**	**Conditions Requiring Subsequent Review**			**Proposed Project Meets the Conditions for an Addendum** *CEQA Guidelines Section 15164*

location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?					

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. As with the Certified EIR, the project site is designated as C-G and has not previously contained any farmland on the site. Currently, the project site is developed with the existing Walmart Supercenter parking lot and is surrounded by a mix of commercial and retail uses along SR-62, including restaurants (Panda Express, Taco Bell, Dickey's Barbecue Pit, Firehouse Subs and Steak 'n Shake), shops (Walmart Supercenter, The Home Depot, Petco, Marshalls and Sally's Beauty), and service-oriented businesses (Avalon Pharmacy and Beauty Suites). The project site and surrounding area do not contain any farmland, are not mapped by the California Important Farmland Finder, and would not result in the conversion of any farmland to non-agricultural use, consistent with the Certified EIR (DOC 2025). With no changes in the physical location of the site, the proposed project would not result in a new impact or a substantial increase in the magnitude of impacts identified in the Certified EIR. Therefore, impacts related to farmland and the conversion of farmland to non-agricultural uses would continue to result in no impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore,

would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed in Impact 3.2.2 (a), the project site is zoned C-G, and no agricultural uses exist on the site or in the vicinity of the project site. The proposed project would remain within the boundaries of the Specific Plan area. As identified by the Certified EIR, the project site is not covered by a Williamson Act contract, and implementation of the proposed project would not result in the termination of such a contract. Therefore, impacts associated with zoning for agricultural use, or a Williamson Act contract would continue to result in no impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed in Impact 3.2.2 (a), the project site is zoned C-G and is fully developed with the existing Walmart Supercenter parking lot. The project site is surrounded by a mix of commercial and retail uses. Based on the Town's General Plan and zoning maps, the Town does not have any lands designated as forest land, timberland, or Timberland Production (Yucca Valley 2014). Therefore, no impact would occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Result in the loss of forest land or conversion of forest land to non-forest use?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Town does not designate or zone any properties as forest land (Yucca Valley 2022, 2014). The

proposed project is located within a developed commercial area and would not affect forest land or forest resources. Therefore, no impact would occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is zoned C-G and is developed with the existing Walmart Supercenter parking lot. The project site is surrounded by a mix of commercial and retail uses. No farmland exists on the project site or in the surrounding area. As discussed in Impact 3.2.2 (a), the project site and surrounding area do not contain any farmland and would not result in the conversion of any farmland to non-agricultural use, consistent with the approved project. Additionally, the Town does not have any land designated or zoned for forest land (Yucca Valley 2022, 2014). Therefore, no impact would occur as previously disclosed in the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.2.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to agricultural resources.

3.3 AIR QUALITY

3.3.1 Summary of Impacts Identified in the Approved Project

- **Air Quality Management Plan Consistency**. The Certified EIR determined that the approved project is consistent with the Mojave Desert Air Quality Management District (MDAQMD) Air Quality Management Plan (AQMP). Because the AQMP is based on local general plan

growth assumptions, projects consistent with the Town's General Plan and zoning designations are considered consistent with the AQMP. The approved project was consistent with both, and therefore the Certified EIR identified less than significant impacts with respect to AQMP consistency.

- **Short-Term Construction Emissions**. The Certified EIR determined that construction-related exhaust, fugitive dust, and VOC emissions would exceed MDAQMD construction thresholds. Although Mitigation Measure 4.3.1A was adopted to reduce exhaust and VOC emissions (e.g., equipment maintenance, dust suppression, and use of low-VOC coatings), the Certified EIR concluded that construction emissions would remain significant and unavoidable.

- **Long-Term Operational Emissions**. The Certified EIR determined that operational (mobile-source) emissions generated by customer and delivery trips would exceed MDAQMD daily thresholds. Implementation of Mitigation Measure 4.3.2A, which requires transportation demand measures (TDMs) to reduce vehicle emissions, would not fully eliminate the exceedances. Therefore, long-term operational air quality impacts were considered significant and unavoidable.

- **Exposure of Sensitive Receptors to Pollutant Concentrations**. The Certified EIR evaluated localized impacts related to carbon monoxide (CO) hotspots and diesel exhaust health risks. The analysis found that project-related traffic would not exceed State or Federal Ambient Air Quality Standards for CO, and health risks from diesel emissions would remain below 10 in a million cancer risk and 1.0 for the chronic hazard index. Accordingly, the Certified EIR concluded that impacts to sensitive receptors would be less than significant.

- **Odors**. The Certified EIR noted that construction and operational activities could produce objectionable odors from equipment exhaust and solid waste handling. However, compliance with Yucca Valley Municipal Code requirements for waste management and material storage would reduce odor impacts to less than significant.

3.3.2 Impacts Associated with the Proposed Project

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

Would the project:

Environmental Issues:	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Conflict with or obstruct implementation of the applicable air quality plan?	LTS	No	No	No	**Yes**
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	SU	No	No	No	**Yes**
c) Expose sensitive receptors to substantial pollutant concentrations?	LTS	No	No	No	**Yes**
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation;
SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based on the *Air Quality and Greenhouse Gas EIR Addendum Analysis Memorandum* and *Health Risk Assessment Memorandum*, both prepared by Kimley-Horn and Associates Inc. dated August 27, 2025, and included in Appendix A and Appendix B, respectively.

a) Conflict with or obstruct implementation of the applicable air quality plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that the approved project is consistent with the MDAQMD Air AQMP, resulting in less than significant impacts. Similarly, the proposed project would be consistent with development in the area and applicable AQMP assumptions. The proposed project would result in six new jobs, which represents a minor increase when compared to the approved project, as described in Section 3.14, *Population and Housing*. The impacts of the proposed project with respect to AQMP consistency would be similar to those analyzed in the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Like the approved project, the proposed project is under the jurisdiction of the MDAQMD and located within the Mojave Desert Air Basin (MDAB). The MDAB includes the desert portions of Los Angeles, Riverside, San Bernardino, and Kern counties. The MDAB is designated as a State and National non-attainment area for ozone and PM_{10} and as a State non-attainment area for particulate matter 2.5 microns in diameter or less ($PM_{2.5}$). An area is considered to be in non-attainment status when air pollution persistently exceeds the State or National AAQS.

CONSTRUCTION EMISSIONS

Proposed project construction activities include the demolition of an area of the existing parking lot, site preparation, grading, building construction, paving, and architectural coating. Maximum daily construction-generated emissions during each year construction activities occurred are summarized in Table 1, *Construction-Related Emissions***,** and compared with the construction emissions identified in the Certified EIR.

Table 1 Construction-Related Emissions

Notes: ROG= reactive organic gases; NO_X = nitrogen oxides; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter 10 microns in diameter or less; $PM_{2.5}$ = particulate matter 2.5 microns in diameter or less; NA = data not available

1 Construction emissions were conservatively modeled assuming a 2025 construction start year, consistent with worst-case emissions modeling assumptions. Construction is currently anticipated to begin in 2026.

It should be noted that modeling for the Certified EIR's construction emission analysis was based on the grading phase of the approved project and used the Urban Emission (URBEMIS) model 2002 to calculate emissions. The URBEMIS software was replaced with California Emission Estimator Model (CalEEMod) in February 2011. This analysis has been prepared using CalEEMod version 2022.1.1.29, the most recent version available at the time this analysis was prepared.

The construction emissions for the proposed project in Table 1 have been conservatively modeled without mitigation and with construction beginning in 2025 and concluding in 2026.[3]

[3] A conservative worst-case construction timeline has been modeled for analysis purposes. This involves modeling emissions at the earliest feasible date. Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover. Project construction that occurs at a later date than what was modeled would result in lower emissions due to the use of more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase in less polluting heavy-duty equipment. As a result, project-related construction emissions would be lower than the impacts disclosed herein. For emissions modeling purposes, conservatively analyzing the emissions using an earlier construction start date provides for a worst-case analysis and full disclosure of potential air quality impacts, as required by CEQA.

As shown in Table 1, the maximum daily emissions would remain below the construction emissions calculated for the approved project and below MDAQMD's thresholds for all criteria pollutants. As a result, impacts associated with the construction of the proposed project would be less than significant and would not require any additional mitigation.

OPERATIONAL EMISSIONS

The main source of air pollutant emissions during operation of the approved and proposed projects is from motor vehicles. The Certified EIR determined that approved project would exceed operational emission thresholds for CO, VOC, NO_X, and PM_{10}. As shown in Appendix F, *Transportation Impact Analysis for the Proposed Walmart Fuel Project in the Town of Yucca Valley*, the proposed project would generate 826 daily trips, which is a net increase of 52 daily trips over the 774 trips anticipated for the fuel station in the Certified EIR.

Operational emissions associated with the approved project and proposed project are summarized in Table 2, *Operational-Related Emissions*. For the purposes of this analysis, the fuel station emissions under the approved project are compared to those of the proposed project. As shown in Table 2, the proposed project's operational emissions are below MDAQMD's criteria pollutant thresholds. However, operational emissions are slightly higher for PM_{10} emissions modeled for the fuel station when compared to the Certified EIR.

Although the proposed project would generate 52 more daily trips than the approved project, the emission rates for vehicles have decreased since the analysis for the Certified EIR was conducted in 2006, due to regulatory requirements, technology improvements, and fleet turnover. With the exception of PM_{10} and $PM_{2.5}$, emission levels would be lower than the previously evaluated fuel station. The proposed project would not change the results when combined with the total emissions of the approved project. Additionally, implementation of the TDM requirements under Mitigation Measure 4.3.2A would contribute to reducing vehicle miles traveled (VMT) under the proposed project. As a result, impacts associated with the construction of the proposed project would be less than significant and would not require any additional mitigation.

1. Approved project emissions are from Certified EIR, Table 4.3.N, page 4.3-41.

2. Approved project fuel station emissions are from Air Quality Analysis, Appendix A: URBEMIS 2002 Model Printouts, page 7, "Mitigated Operational Emissions" (Certified EIR Appendix B).

SUMMARY

The Certified EIR identified construction and operational exceedances of MDAQMD thresholds for criteria air pollutants and concluded that the approved project would result in a significant and unavoidable impact. However, the proposed project would not exceed any MDAQMD thresholds and therefore would result in a less than significant impact. The Certified EIR identified Mitigation Measure 4.3.1A to reduce construction emissions of criteria pollutants, which would still be required as part of the proposed project to reduce cumulative impacts.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the

criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Expose sensitive receptors to substantial pollutant concentrations?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that the exposure of sensitive receptors to harmful pollutant concentrations associated with the approved project would be less than significant. The Certified EIR analyzed CO emission hotspots from the vehicular traffic increase in local areas as well as diesel emissions from truck deliveries as a result of the approved project. The Certified EIR studied 22 intersections in the project vicinity and determined that none of the studied intersections would exceed State standards.

As shown in Table 2, CO emissions generated by the proposed project would be lower than those modeled for the approved project. Therefore, the development of the proposed project would not result in CO hotspots. The Certified EIR also determined that operational health risk impacts would be less than significant. Typical sources of carcinogenic and chronically hazardous toxic air contaminants (TACs) mostly include diesel particulate matter (DPM) from trucks and industrial manufacturing processes. As with the Certified EIR of the approved project, the proposed project would include delivery trucks that would generate DPM. The analysis for the Certified EIR determined that emissions would not exceed the 10 in one million carcinogenic health risk threshold or the 1.0 chronic health index threshold.

Although it is not discussed in the Certified EIR, TACs would also be generated by the fuel station component of the approved project. A Health Risk Assessment (HRA) was prepared to assess the DPM emissions from construction equipment used during construction of the proposed project and TAC (benzene) emissions from the operation of the fuel station, which were not included in the Certified EIR analysis (see Appendix B, *Health Risk Assessment Memorandum*). Of the toxic compounds emitted from gasoline stations, benzene, ethylbenzene, and naphthalene have cancer toxicity values. However, benzene is the TAC that drives the risk, accounting for 87 percent of cancer risk from gasoline vapors, and constitutes more than four times the weight in gasoline than ethylbenzene and naphthalene, respectively. Therefore, ethylbenzene and naphthalene have not been modeled and are instead considered significant if benzene emissions are significant. Benzene emissions associated with the proposed project were computed based on the maximum anticipated throughput of fuel (i.e., approximately 5 million gallons per year), using California Air Resources Board (CARB) emission factors for fuel-dispensing facilities and assuming that benzene makes up 0.46 percent of gasoline vapor.

CARB and MDAQMD have adopted regulations requiring all gasoline dispensing facilities to use vapor recovery systems to capture VOCs emitted during both delivery and refueling. These systems include Phase I equipment, capturing vapors from fuel tank deliveries, and Phase II equipment, recovering fuel vapors generated at the nozzle during vehicle fueling. This limits

exposure to toxic air contaminates like benzene, protecting workers and nearby communities. Facilities must use CARB-certified equipment, undergo regular performance testing (annual or semi-annual depending on throughput), maintain logs, and ensure all components (nozzles, hoses, etc.) meet stringent standards to reduce VOC emissions.

Table 3, *Cancer Risk Assessment Results*, shows that carcinogenic risk resulting from the proposed project would not exceed the 10 in one million threshold. The calculations conservatively assume no cleaner technology with lower emissions in future years. Table 3 shows that at the maximally exposed receptor, construction risk would be 0.15 in one million, and operational risk would be 0.393 in one million. Worst-case worker exposure would also not exceed the 10 in one million threshold. Therefore, carcinogenic hazards are calculated to be within acceptable limits, and impacts would be less than significant with respect to cancer risk.

Table 3 Cancer Risk Assessment Results

Receptors	Cancer Risk (per million) [1,2,3]				
	Construction	Operations			Construction and Operation Combined
		Trucks	Fuel Station	Total Operations	
Residences					
Approximately 440 feet northeast	0.13	0.003	0.39	0.393	0.523
Approximately 462 feet northwest	0.15	0.002	0.34	0.342	0.492
Significance Threshold (Risk per Million)	10	10	10	10	10
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**
Worker Exposure					
Approximately 118 feet east	0.09	0.003	0.80	0.803	0.893
Significance Threshold (Risk per Million)	10	10	10	10	10
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**

Source: Kimley-Horn 2025b (Appendix B)

Notes:

1. The reported risk is at the closest receptor (maximally exposed individual receptor [MEIR]) for each exposure category.

2. Risk from construction and trucks is from PM_{10}, and risk from the gas dispensing facility is benzene.

3. The maximum cancer risk is based on worst-case exposure durations for the project; 95th percentile breathing rates for less than two years old and 80th percentile for two years and older; and 30-, 25-, and 9-year averaging time for residences, workers, and students, respectively.

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Acute and chronic impacts of the proposed project are shown in Table 4, *Chronic and Acute Hazard Assessment Results*. An acute or chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the acute or chronic exposure by the reference exposure level. Table 4 shows that non-carcinogenic hazards are calculated to be within acceptable limits, resulting in a less than significant impact.

Table 4 Chronic and Acute Hazard Assessment Results

Emissions Sources	Chronic Hazard	Acute Hazard
Residential Receptors		
Construction	0.000256	N/A
Trucks	0.000001	N/A
Fuel Station	0.006269	0.016999
Threshold	1.0	1.0
Threshold Exceeded?	**No**	**No**
Worker Receptors		
Construction	0.001813	N/A
Trucks	0.000002	N/A
Fuel Station	0.011827	0.027863
Threshold	1.0	1.0
Threshold Exceeded?	**No**	**No**

Source: Kimley-Horn 2025b (Appendix B).

Notes: N/A = not applicable, acute health risk for DPM cannot be calculated

No new impacts relative to carcinogenic health risk or non-carcinogenic hazards evaluated in the Certified EIR would occur with the development of the proposed project. As described above, the proposed project's carcinogenic risk would not exceed the MDAQMD's threshold of 10 in one million and non-carcinogenic hazards are also below the acceptable limits. It should be noted that the Certified EIR did not analyze TAC emissions associated with the fuel station. However, consistent with CARB's *Gasoline Service Station Industrywide Risk Assessment Technical Guidance Manual* and *Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document*, these emissions have been included in this health risk analysis. As noted previously, even with these additional sources of TACs, the health risk remains below MDAQMD's thresholds.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The MDAQMD regulates odors through Rule 402 (Nuisance). Rule 402 prohibits the discharge from any source that cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. Typical land uses that generate odors include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding.

During construction-related activities, some odors (not substantial pollutant concentrations) that may be detected are those typical of construction vehicles (e.g. diesel exhaust from grading and construction equipment). These odors are a temporary short-term impact that is typical of construction projects and would disperse rapidly. The Certified EIR for the approved project determined that odors associated with the approved project would be less than significant. Consistent with the Certified EIR, the proposed project would not include any of the land uses that have been identified by the MDAQMD as odor sources. Therefore, the proposed project would not create objectionable odors.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and**,** therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.3.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. Mitigation Measure 4.3.2A was incorporated as part of the approved project and does not apply to the proposed project. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and <u>underline</u> for new, inserted text.

The Certified EIR Mitigation Measure 4.3.1A and 4.3.2A are reproduced below.

> **4.3.1A** Prior to issuance of grading permits, the construction contractor shall provide evidence showing that the following measures shall be implemented to reduce NO_X and

PM_{10} emissions from ground disturbance and VOC emissions from application of architectural coatings:

- The construction contractor shall select the construction equipment used on site based on low emission factors and high energy efficiency. The construction contractor shall ensure that construction grading plans include a statement that all construction equipment will be tuned and maintained in accordance with the manufacturer's specifications.
- The construction contractor shall demonstrate to the Town that construction activities shall make use of alternatively fueled equipment or catalyst-equipped diesel powered equipment to the extent such alternative fuels are available.
- The construction contractor shall ensure that construction grading plans include a statement that work crews will shut off equipment when not in use.
- The construction contractor shall time the construction activities so as not to interfere with peak hour traffic and to minimize obstruction of through traffic lanes adjacent to the site; if necessary, a flagperson shall be retained to maintain safety adjacent to existing roadways.
- The construction contractor shall support and encourage ridesharing and transit incentives for the construction crew.
- The construction contractor shall demonstrate compliance with the fugitive dust suppression measures 403 a) through 403 e) contained in MDAQMD Rule 403.
- The construction contractor shall demonstrate compliance with the VOC suppression measures contained in MDAQMD 1113.
- The construction contractor shall apply non-toxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
- The construction contractor shall water active sites at least twice daily (Locations where grading is to occur shall be thoroughly watered prior to earthmoving).
- The construction contractor shall provide evidence to the Town that all trucks hauling dirt, sand, soil, or maintain at least two feet of freeboard (vertical

space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code (CVC) section 23114.

- The construction contractor shall pave construction access roads at least 100 feet onto the site from the main road.
- The construction contractor shall promote the reduction of traffic speeds on all unpaved roads to 15 miles per hour (mph) or less.

~~**4.3.2A** Prior to issuance of building permits, the project applicant shall provide evidence to the Town that applicable (as determined by the Town) Transportation Demand Management (TDM) measures are incorporated into the design of the proposed project. At a minimum, the TDM measures shall include: 1) Bicycle Storage – The project shall provide secure, adequate and convenient bicycle storage facilities for a minimum of 12 bicycles; 2) Information Center – A transportation information center shall be provided within the Wal-Mart store; and 3) preferential parking for employee carpool. The information center shall be located in a central location will good customer visibility. The information center shall provide information concerning public transportation options including route and schedules for local bus service.~~

3.4 BIOLOGICAL RESOURCES

3.4.1 Summary of Impacts Identified in the Approved Project

- **Special-Status Species.** The Certified EIR concluded that seven non-listed sensitive species had a low potential to occur on-site, including the loggerhead shrike, California horned lark, and San Diego black-tailed jackrabbit, which were observed on-site during surveys. The Certified EIR determined that construction activities could affect nesting birds protected under the Migratory Bird Treaty Act (MBTA). Therefore, Mitigation Measure 4.4.1C requires a pre-construction nesting bird survey if work occurs during the nesting season. Additionally, because burrowing owl was not detected but could occur, Mitigation Measures 4.4.1A through 4.4.1C were incorporated to ensure impacts would be reduced to less than significant levels.
- **Riparian Habitat or Other Sensitive Natural Communities.** The Certified EIR determined that no jurisdictional waters or riparian habitats were present on the site. However, the plant palette for the approved project included Mexican palo verde (*Parkinsonia aculeata*), a non-native species under review by the California Invasive Pest Plant Council (Cal-IPC) for potential invasiveness. Mitigation Measure 4.4.2A prohibits the use of this species in

landscaping. With implementation of this measure, impacts to sensitive natural communities were considered less than significant.

- **Jurisdictional Waters/Wetlands.** Field reconnaissance identified no wetlands, blue-line streams, or other jurisdictional features on the project site. Therefore, the Certified EIR determined that the approved project would result in no impact to jurisdictional waters or wetlands communities.

- **Wildlife Movement or Habitat Fragmentation.** The Certified EIR found that the project site is surrounded by existing development and roadways to the north, east, and west, which already act as barriers to wildlife movement. Although a small loss of Joshua tree woodland would occur, the project would not result in substantial habitat fragmentation or impede existing wildlife corridors. Therefore, impacts to wildlife movement were determined to be less than significant.

- **Local Policies and Ordinances.** The Certified EIR determined that the approved project would comply with the Town of Yucca Valley's Native Plant Protection and Management Ordinance, which requires permits for removal of native species such as Joshua tree, yucca, and California juniper, consistent with the California Desert Native Plants Act (Food and Agricultural Code Section 80001 et seq.). Therefore, impacts associated with compliance with local biological resource policies and ordinances were determined to be less than significant.

- **Habitat Conservation Plans.** The Certified EIR identified that the project site is not covered by any adopted habitat conservation plan, but lies within the Western Mojave Recovery Unit of the Desert Tortoise Recovery Plan, outside any designated management area. At the time of certification, the West Mojave Plan was in draft form and, if approved, could include the project area; however, the project site was not within any designated conservation area and would not conflict with the draft plan's provisions. Therefore, impacts related to habitat conservation plans were considered less than significant.

3.4.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	LTS/M	No	No	No	**Yes**
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	LTS/M	No	No	No	**Yes**
c) Have a substantial adverse effect on state or federally protected	NI	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?					
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	LTS	No	No	No	**Yes**
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	LTS	No	No	No	**Yes**
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation;
SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is now fully developed and paved as part of the approved commercial center analyzed in the Certified EIR, and no remaining natural or undeveloped areas remain within the site boundaries. Accordingly, the site no longer provides suitable habitat for special-status species, burrowing owl, or other ground- or vegetation-dependent wildlife. Because the site is entirely developed, Mitigation Measures 4.4.1A (focused burrowing owl surveys) and 4.4.1B (avoidance and relocation procedures) are no longer applicable or necessary. However, consistent with the Certified EIR, Mitigation Measure 4.4.1C (protection of nesting birds pursuant to the Migratory Bird Treaty Act) remains applicable to ensure compliance with federal and state regulations in case of any nesting activity in ornamental trees or structures during construction. With implementation of Mitigation Measure 4.4.1C, potential impacts to special-status species would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area, and as with the Certified EIR, no potential jurisdictional waters or riparian habitat were identified on the proposed site. As identified in the Certified EIR of the approved project, the Town's plant palette calls for the planting of Mexican palo verde trees (*Parkinsonia aculeate*) which has the potential to affect natural sensitive communities. The proposed project would incorporate Mitigation Measure 4.4.2A, to exclude the Mexican palo verde trees from the proposed project landscaping plan. Therefore, impacts would be reduced to less than significant with mitigation, consistent with the approved project.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area, and consistent with the Certified EIR, no potential jurisdictional waters or riparian habitat were identified on the project site. Consistent with the Certified EIR, the proposed project would have no impact on state or federally protected wetlands.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is now fully developed and consists entirely of paved parking areas and ornamental landscaping associated with the existing Walmart Supercenter. The site no longer supports Joshua tree woodland or other native vegetation identified in the Certified EIR. Surrounding development and roadways already preclude wildlife movement through the area, and the site no longer functions as part of a migratory corridor or wildlife nursery. As such, the proposed project would not interfere with wildlife movement or habitat connectivity. However, consistent with the Certified EIR, Mitigation Measure 4.4.1C (compliance with the Migratory Bird Treaty Act and California Fish and Game Code) remains applicable to ensure protection of potential nesting birds in ornamental trees or structures during the nesting season. With implementation of Mitigation Measure 4.4.1C, impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the

criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area and would be subject to the same local and regional policies and ordinances related to biological resources. Since the certification of the EIR for the approved project, protected plants on-site, such as the silver cholla, beavertail cactus, diamond cholla, and western Joshua tree, were relocated from the project site. The nearest western Joshua tree is more than 60 feet from the project site, and the site currently contains ornamental landscaping identified in Yucca Valley's plant palette. However, any project that involves ground-disturbing activities is required to submit a Native Plant Permit with photos in accordance with the Biological Resources Element of the General Plan and the Native Plant Protection and Management Ordinance to confirm the presence or absence of Joshua tree, Mojave yucca, Parry's nolina, California juniper, Our Lord's candle, or Pinon pine (*Pinus monophylla*) (Yucca Valley 2022). If any of these species are identified on the site during the Native Plant Permit process, the applicant would be required to submit a plot plan for approval in accordance with local policies. In addition, the Native Plant Protection and Management Ordinance requires compliance with provisions of the California Desert Native Plants Act. A plot plan must be approved by the Community Development Department identifying which trees or plants are authorized for removal or relocation.

The proposed project would adhere to the palette of plants prescribed in the Specific Plan for the proposed landscaping, in accordance with Policy 8 of the Biological Resources Element of the General Plan. Therefore, with adherence to local policies and ordinances, impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area.

As identified by the Certified EIR, the project site is not covered by any habitat conservation plans. The proposed project is not within a designated management area of the Desert Tortoise Recovery Plan (USFWS 2011). The Draft West Mojave Plan remains in progress (BLM 2025). The proposed project may be subject to provisions of the Plan (e.g., payment of fees) upon adoption of the plan; however, there are currently no habitat mitigation fees established. Therefore, impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.4.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. The Certified EIR included Mitigation Measures 4.4.1A, 4.4.1B, 4.4.1C, 4.4.2A, 4.4.3A, and 4.4.3B. However, because the project site has since been fully developed as a paved commercial parking lot, Mitigation Measures 4.4.1A and 4.4.1B (burrowing owl surveys and relocation procedures) and 4.4.3A and 4.4.3B (on-site habitat restoration) are no longer applicable. Mitigation Measure 4.4.1C (protection of nesting birds under the MBTA and California Fish and Game Code) remains applicable to ensure compliance if active nests are present during construction or demolition activities. Mitigation Measure 4.4.2A (protection or relocation of Joshua trees and other native plants) remains included for reference and consistency with the Certified EIR, although no Joshua trees or native vegetation currently exist on the developed project site. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and <u>underline</u> for new, inserted text.

> ~~**4.4.1A** Prior to site grading, a focused survey for the burrowing owl shall be conducted on the project site by a qualified biologist to determine on-site presence/absence of this species. The focused burrowing owl survey shall be conducted during the appropriate breeding season (February 1 to August 31) and/or within 30 days prior to the commencement of grading activities. If the survey determines that the burrowing owl is present, Mitigation Measure 4.4.1B shall apply. Conversely, if the burrowing owl is absent from the project site, no further mitigation is required.~~
>
> ~~**4.4.1B** Any burrowing owls identified during on-site focused surveys shall be relocated by a qualified biologist prior to the commencement of grading activities. The relocation~~

~~of any specimen shall be conducted per applicable CDFG and/or USFWS procedures. Relocation of on-site burrowing owls shall not be permitted during the nesting season for this species.~~

4.4.1C In accordance with the MBTA, the removal of vegetation or other potential nesting habitat shall be conducted outside of the avian nesting season (February through August). If construction occurs during the avian nesting season, a pre-construction nesting bird survey shall be conducted seven days prior to any ground disturbing activities. If birds are found to be nesting inside, or within 250 feet (500 feet for raptors) of the impact area, construction will need to be postponed until it is determined by a qualified biologist that the nest is no longer active.

4.4.2A Exclude the Mexican Palo Verde tree (*Parkinsonia aculeate*) from the plant palette proposed in the landscaping plan.

~~**4.4.3A** In compliance with the USFWS 1992 Field Survey Protocol for desert tortoise, a preconstruction clearance survey is required in addition to the focused protocol survey. A preconstruction clearance survey shall be conducted within 30 days prior to any ground disturbing activities. If the clearance survey is positive, incidental take permits will be required from the USFWS and the CDFG prior to any ground disturbing activities. The permits would stipulate required actions such as relocation of the tortoises, installation of a tortoise proof fence, etc.~~

~~**4.4.3B** Pursuant to the USFWS 1992 Field Survey Protocol, focused presence/absence surveys, which must be conducted during the activity period of the tortoise between March 25 and May 31, are valid for one year. Therefore, if construction is not initiated prior to March 25, 2007, another focused protocol survey will be required between March 25 and May 31 to determine presence/absence of desert tortoise within the project site impact area. If the focused protocol survey is positive, incidental take permits will be required from the USFWS and the CDFG.~~

3.5 CULTURAL RESOURCES

3.5.1 Summary of Impacts Identified in the Approved Project

- **Historical Resources.** The Certified EIR identified that the former historic SR-62 was located along the northern boundary of the project area. However, regular maintenance, resurfacing, and widening to a four-lane thoroughfare have obliterated any trace of the original highway alignment. The Certified EIR concluded that no further investigation or monitoring was warranted for SR-62 and that no other historical structures or features were present on-site. The EIR noted, however, that buried historical resources could potentially be discovered during grading or construction. Implementation of Mitigation Measure 4.5.1A

requires procedures for the evaluation and protection of any inadvertently discovered historical resources, ensuring impacts would be less than significant.

- **Archaeological Resources**. The Certified EIR reported that no archaeological resources were identified during the literature search or field survey. Nonetheless, grading could expose previously unknown buried archaeological resources. The Certified EIR required implementation of Mitigation Measures 4.5.2A and 4.5.2B, which mandate archaeological monitoring during ground disturbance and appropriate treatment of discovered resources. With these measures in place, impacts related to archaeological resources were determined to be less than significant.

- **Human Remains.** The Certified EIR found that no cemeteries or known human remains exist within the project site. However, because ground-disturbing activities could inadvertently uncover unknown human remains, compliance with State Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 is required. These statutes mandate immediate cessation of work, notification of the San Bernardino County Coroner, and, if applicable, consultation with the NAHC and the Most Likely Descendant to determine appropriate treatment. Adherence to these existing regulations ensured impacts would be less than significant.

3.5.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	LTS/M	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	LTS/M	No	No	No	**Yes**
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. The project site is bordered by SR-62 to the north; however, as identified in the Certified EIR, regular maintenance, resurfacing, and widening to a four-lane thoroughfare has obliterated any trace of the historic portions of Highway 62 within or adjacent to the project site. Additionally, the project site is not listed in the California Register of Historical Resources, National Register of Historic Places, California State Historical Landmarks, or Points of Historical Interest or in a local register of historical resources (OHP 2025, NPS 2025). However, the proposed project could result in the discovery of unknown buried historical resources as a result of excavations needed for the USTs. Mitigation Measure 4.5.1A from the Certified EIR would ensure potential impacts remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the

criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

The proposed project would be within the boundaries of the approved Specific Plan area. As such, the Certified EIR findings would apply to the proposed project. Although no on-site archaeological resources were identified during the literature search or field survey, the potential for discovery of unknown buried archaeological resources, including tribal cultural resources, remains during grading or construction. Mitigation Measures 4.5.2A, and 4.5.2B from the Certified EIR would reduce impacts to a less than significant level.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Disturb any human remains, including those interred outside of dedicated cemeteries?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.
As discussed in the Certified EIR, no cemetery or human remains have been identified on-site. Since certification of the EIR, the project site has since been developed with the Walmart Supercenter parking lot; therefore, the likelihood of discovering unknown human remains is low. Nevertheless, earthwork activities associated with the construction of the proposed project still have the potential to unearth unknown human remains. Adherence to state and federal policies including Section 7050.5 of the State's Health and Safety Code, and Public Resources Code Section 5097.98 would require halting work, notification of the County Coroner and the Native American Heritage Commission, and consultation with the most likely descendent as needed. Compliance with these existing requirements would ensure impacts remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.5.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. These mitigation measures have been incorporated into the proposed project's mitigation monitoring and reporting program. Mitigation Measure 4.5.2.B has been modified as applicable to reflect minor changes generated by the SB 18 consultation process for the proposed project. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and underline for new, inserted text.

The Certified EIR Mitigation Measures 4.5.1A, 4.5.2A, and 4.5.2B are reproduced below.

> **4.5.1A** In the event a historical resource is uncovered, discovered, or otherwise detected or observed during the course of grading or construction of the project, ground-disturbing activities within 50 feet of the find shall cease until the nature and extent of the find can be evaluated by a qualified historian (meeting Secretary of Interior Standards) If any such resource is uncovered during the course of project-related grading or construction, appropriate mitigation measures, recordation, and removal procedures shall be required prior to any resumption of work in the affected area of the project.
>
> **4.5.2A** Prior to grading activities, an archeological resource monitoring plan shall be submitted for review and approved by the Town. The archeological resource monitoring plan shall require monitoring of the upper ten (10) feet of topsoil. If after 100 percent of soils to five (5) feet below original grade has been monitored and no archaeological resources have been identified, the Project Archaeologist may discontinue monitoring. In the event an archaeological resource is uncovered, discovered, or otherwise detected or observed during the course of grading or construction of the project, ground-disturbing activities within 50 feet of the find shall cease until the nature and extent of the find can be evaluated by a qualified archaeologist (meeting Secretary of Interior Standards). If any such resource uncovered during the course of project-related grading or construction, appropriate mitigation measures, recordation, and removal procedures shall be required prior to any resumption of work in the affected area of the project.
>
> **4.5.2B** ~~In the event a Native American cultural resource is uncovered, discovered, or otherwise detected or observed during the course of grading or construction of the project,~~ Prior to the start of construction, ~~the~~ one tribal monitor from the Consulting Tribe (either Yuhaaviatam of San Manuel Nation, Morongo Band of Mission Indians,

Agua Caliente Band of Cahuilla Indians, or Twenty-nine Nine Palms Band of Mission Indians) shall be~~,~~ hired by the project applicant~~,~~ to ~~shall contact the Morongo Band of Mission Indians ("Tribe"). If requested by the Tribe, the monitor, at the applicant's discretion, shall~~ provide monitoring during ground disturbing construction activities, and if needed, consult on the discovery and its disposition.

3.6 ENERGY

3.6.1 Summary of Impacts Identified in the Approved Project

The Certified EIR did not address energy impacts as an Appendix G checklist topic because it was drafted and adopted before the Natural Resources Agency revised Appendix G of the CEQA Guidelines to add energy as a distinct Appendix G checklist topic consistent with Appendix F of the CEQA Guidelines.

The Certified EIR discussed energy consumption with respect to significant irreversible environmental effects, noting that while the approved project would consume electricity and natural gas resources, the approved project would not result in the loss of availability of these resources. The Certified EIR also evaluated the approved project's consistency applicable greenhouse gas emissions reductions strategies including the California Building Energy Efficiency Standards and Appliance Energy Efficiency Standards. This analysis noted that mitigation measures incorporated to reduce air quality impacts, Mitigation Measures 4.3.1A and 4.3.2A, would also reduce energy consumption during construction and operation of the approved project.

3.6.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	N/A	No	No	No	**Yes**
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	N/A	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based in part on the *Air Quality and Greenhouse Gas EIR Addendum Analysis Memorandum* prepared by Kimley-Horn and Associates Inc. on August 27, 2025, and included in Appendix A.

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

CONSTRUCTION

As with the development pursuant to the Certified EIR, construction of the proposed project would consume energy in the short term through electricity use, construction vehicles and equipment fuel consumption, and bound energy in construction materials (e.g., asphalt, steel, concrete, pipes, lumber, glass).

Electrical Energy

The majority of construction equipment would be gas or diesel powered, and electricity would not be used to power most of the construction equipment. Electricity use during construction would vary during different phases of construction. Later construction phases could result in the use of electricity-powered equipment for interior construction and architectural coatings. It is anticipated that the majority of electric-powered construction equipment would be hand tools (e.g., power drills, table saws) and lighting, which would result in minimal electricity usage during construction activities. Therefore, project-related construction activities would not result in wasteful or unnecessary electricity demands, and impacts would be less than significant. Furthermore, development under the proposed project would not introduce new types of construction processes or activities compared to what was previously considered in the Certified EIR. Therefore, the proposed project would not result in a significant impact related to electricity use during the construction phase.

Natural Gas Energy

It is not anticipated that construction equipment used for the proposed project would be powered by natural gas, and no natural gas demand is anticipated during construction. Furthermore, development under the proposed project would not introduce new types of construction processes or activities compared to what was previously considered in the Certified EIR. Therefore, the proposed project would not result in a significant impact related to natural gas usage during the construction phase.

Transportation Energy

Transportation energy use depends on the type and number of trips, vehicle miles traveled, fuel efficiency of vehicles, and travel mode. Transportation energy use during construction would come from the transport and use of construction equipment, delivery vehicles and haul trucks, and construction employee vehicles that would use diesel fuel and/or gasoline. It is anticipated that the majority of off-road construction equipment, such as those used during grading, would be gas or diesel powered.

The use of energy resources by vehicles and equipment would fluctuate according to the phase of construction. In addition, construction equipment would cease operating upon completion of proposed project construction. Thus, impacts related to transportation energy use during

construction would be temporary and would not require expanded energy supplies or the construction of new infrastructure.

Furthermore, to limit wasteful and unnecessary energy consumption, the construction contractors would minimize nonessential idling of construction equipment during construction, in accordance with the California Code of Regulations, Title 13, Article 4.8, Chapter 9, Section 2449. Construction trips would also not result in unnecessary use of energy since the project site is centrally located and is served by numerous regional freeway systems (e.g., SR-62) that provide the most direct routes from various areas of the region.

Moreover, development under the proposed project would not introduce new types of construction processes or activities compared to what was previously considered in the Certified EIR. No unusual project characteristics would necessitate the use of construction equipment that would be less energy efficient than for development pursuant to the approved project. Therefore, it is expected that construction fuel consumption associated with the proposed project would not be any more inefficient, wasteful, or unnecessary than the energy required for development contemplated in the Certified EIR.

OPERATION

Operation of the proposed project would generate similar demand for energy when compared to the approved project. Operational energy sources include building electricity and natural gas associated with the convenience store building and lighting at the fuel station, in addition to transportation energy demand associated with vehicles traveling to and from the site. As a fuel station project, the proposed project would involve expansion of an approved fuel station at the project site to support the sale of transportation fuels and would not directly result in wasteful or unnecessary fuel consumption. The proposed project would meet existing and forecast demand for additional fuel and would not induce additional demand. Moreover, additional demand or consumption of energy resources does not mean the consumption or demand thereof would be inefficiency, wasteful, or unnecessary. Fuel consumption resulting from operation of the proposed project that is under the control of the project proponent would be limited to company-sponsored vehicle trips (e.g., contracted deliveries) and equipment use on-site, which would be necessary for the operation of the proposed project. Therefore, as discussed in greater detail below, operation of the proposed project would not be any more inefficient, wasteful, or unnecessary than the fuel consumption required for development contemplated in the Certified EIR.

Building Energy Use

The electricity and natural gas consumption associated with the building and lighting fixtures under the proposed project are shown in Table 5, *Operation-Related Energy Consumption*. Because energy use under the approved project was not quantified in the Certified EIR, this analysis conservatively accounts for the total increase in electricity and natural gas consumption

associated with the uses under the proposed project. Energy use from the same uses under the approved project would be similar to that of the proposed project.

Table 5 Operation-Related Energy Consumption

	Electricity (kWh/year)	Natural Gas (KBTU/year)
Convenience Store with Gas Station	50,223	26,265
Parking Lot	44,767	0
TOTAL	**94,990**	**26,265**

Source: Kimley-Horn 2025a (Appendix A)

Notes: kWh = kilowatt-hours; KBTU = kilo-British Thermal Units

Electricity and natural gas use are based on the proposed project's CalEEMod default energy consumption shown in Appendix A.

While the proposed project would generate energy demand at the site, it would still be required to comply with the latest Building Energy Efficiency Standards and CALGreen standards. In addition to the proposed building energy efficiency, Southern California Edison (SCE) is required to comply with the state's renewable portfolios standard (RPS), which mandates utilities to procure a certain proportion of electricity from eligible renewable and carbon-free sources and increasing the proportion through the coming years with an ultimate procurement requirement of 100 percent by 2045. The RPS requirements would support use of electricity by the proposed project that is generated from renewable or carbon-free sources. Energy consumption for the on-site uses would also be similar to that of the approved project. Therefore, it is expected that building and lighting energy consumption associated with the proposed project would not be any more inefficient, wasteful, or unnecessary than the energy required for development contemplated in the Certified EIR.

Transportation Fuel Use

The proposed project would consume transportation energy during operations from the use of motor vehicles associated with employees and patrons of the proposed project. The proposed project would generate a net increase in 52 average daily vehicle trips over the approved project (see Appendix F). To provide a conservative estimate of transportation fuel consumption under the proposed project, the fuel associated with the project's total increase of 826 trips is shown in Table 6, *Annual Transportation Energy Fuel Consumption*.

Table 6 Annual Transportation Energy Fuel Consumption

Fuel Type	Proposed Project
Gasoline	
VMT	4,451,855
Gallons	200,543
Miles per Gallon	22.20
Diesel	
VMT	263,608
Gallons	25,610
Miles per Gallon	10.29
Compressed Natural Gas	
VMT	6,792
Gallons	897
Miles per Gallon	7.57
Electricity	
VMT	354,777
kWh	124,652
Miles per kWh	2.85
Total VMT	**5,077,032**

Source: EMFAC 2025 (v.2.0.0); Kimley-Horn 2025a, 2025d.

Notes: CalEEMod default fleet mix from Appendix A, project trip estimate from Appendix F; EMFAC emissions inventory used year 2025, consistent with the operational year used for the AQ/GHG modeling in Appendix A.

Fuel efficiency of vehicles after full buildout would improve on average compared to vehicle fuel efficiencies experienced under existing conditions, thereby resulting in a lower per capita fuel consumption, assuming travel distances, travel modes, and trip rates remain the same. The improvement in fuel efficiency would be attributable to the statewide fuel reduction strategies and regulatory compliances (e.g., Corporate Average Fuel Economy [CAFE] standards), resulting in new cars that are more fuel efficient and the attrition of older, less fuel-efficient vehicles. The CAFE standards are not directly applicable to land use development projects, but to car manufacturers. Thus, the drivers do not have direct control in determining the fuel efficiency of vehicles manufactured and that are made available. However, compliance with the CAFE standards by car manufacturers would ensure that vehicles produced in future years have greater fuel efficiency and would generally result in an overall benefit of reducing fuel usage by providing more fuel-efficient vehicle options to consumers. Last, because electricity consumed in California is required to meet the increasing renewable energy mix requirements under the State's RPS and accelerated by SB 1020, greater and greater proportions of electricity consumed for transportation energy demand envisioned under the proposed project would be generated from renewable energy sources rather than fossil fuels through 2045.

Furthermore, the proposed project's net increase of 52 trips would result in transportation fuel consumption similar to that of the proposed project. Overall, project operations would not result in excessive and wasteful vehicle trips and VMT, nor excess and wasteful vehicle energy consumption compared to the approved project.

SUMMARY

Energy use under the proposed project would be similar to that of the approved project. Both the proposed project and approved project include a fuel station land use, the construction and operation of which would result in similar electricity and natural gas consumption on the site. While the proposed project would increase trips to the project site when compared to the approved project, this approximately 7 percent net increase in trips associated with the fuel station/convenience store would result in similar a similar net increase fuel usage. Therefore, when compared to the approved project, the proposed project would not increase impacts with respect to unnecessary, wasteful, or inefficient energy consumption.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would be required to adhere to federal, State, and local requirements for energy efficiency, including the California Energy Code Building Energy Efficiency Standards (California Code of Regulations [CCR] Title 24, Part 6) and the CALGreen Code (24 CCR Part 11). Building energy efficiency standards establish minimum efficiency standards related to various building features, including appliances, water and space heating and cooling equipment, building insulation and roofing, and lighting. Compliance with Building Energy Efficiency Standards and CALGreen requirements would help to significantly reduce energy usage associated with the proposed project.

CALIFORNIA RENEWABLES PORTFOLIO STANDARD PROGRAM

The State's electricity grid is transitioning to renewable energy under California's RPS Program. Eligible renewable sources under the RPS include wind, small hydropower, solar, geothermal, biomass, and biogas. The RPS goals have been updated since adoption of SB 1078 in 2002. In general, California has RPS requirements of 50 percent renewable energy by 2026 (SB 100), 60 percent by 2030 (SB 100), 90 percent by 2035 (SB 1020), and 100 percent carbon free by 2045 (SB 100 and SB 1020). The statewide RPS goal is not directly applicable to individual

development projects but to utilities and energy providers such as SCE, which is the utility that would provide the entirety of the electricity needs for the proposed project. SCE's compliance with the RPS goals would support the State in meeting its objective in transitioning to renewable energy.

The statewide RPS goal is not directly applicable to individual development projects, but to utilities and energy providers such as SCE, which is the utility that would provide all of the electricity needs for the Proposed Project. Compliance of SCE in meeting the RPS goals would ensure the State in meeting its objective in transitioning to renewable energy. Similar to the approved project, the proposed project would be subject to Building Energy Efficiency Standards and CALGreen requirements. The increase in fuel pumps under the proposed project would not result in new or increase the severity of impacts as it pertains to consistency with renewable energy or energy efficiency plans compared to the approved project.

No changes proposed by the proposed project compared to the approved project would result in any new or substantially more severe significant impacts with respect to obstructing a state or local plan for renewable energy or energy efficiency. Therefore, preparation of a supplemental or subsequent EIR is not required by CEQA.

3.6.3 Adopted Mitigation Measures Applicable to the Proposed Project

The Certified EIR did not analyze energy impacts pursuant to the CEQA Guidelines Appendix G checklist questions. Therefore, the Certified EIR did not incorporate any mitigation measures to reduce impacts related to energy. As discussed above, energy usage of the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.7 Geology and Soils

3.7.1 Summary of Impacts Identified in the Approved Project

- **Rupture of a Known Earthquake Fault**. Although the Town of Yucca Valley is in a seismically active region, the project site is not located within an Alquist–Priolo Earthquake Fault Zone and no known faults cross the site. The Certified EIR found the potential for on-site ground rupture to be very low and impacts less than significant.

- **Strong Seismic Ground Shaking**. Because the site is in a seismically active area, the Certified EIR determined potentially significant impacts from strong ground shaking; with implementation of Mitigation Measure 4.6.1A (CBC/UBC-consistent seismic design and geotechnical recommendations), impacts would be reduced to less than significant.

- **Seismic-Related Ground Failure, Including Liquefaction**. Based on subsurface conditions and groundwater depth, the Certified EIR determined the liquefaction potential to be very low and impacts less than significant.

- **Landslides**. The Certified EIR found the site is not in mountainous or hilly terrain and the potential for landslides is very low; impacts are less than significant.

- **Soil Erosion or Loss of Topsoil**. Because construction would disturb more than one acre, the Certified EIR required compliance with National Pollutant Discharge Elimination System (NPDES) / Construction General Permit (CGP) and a SWPPP with Best Management Practices (BMPs), plus MDAQMD Rules 402/403 for dust control; with these measures, erosion impacts would be less than significant.

- **Unstable Soils (landslide, lateral spreading, subsidence, liquefaction, collapse).** The Certified EIR identified potential settlement/instability as potentially significant; implementation of Mitigation Measure 4.6.2A (site-specific geotechnical design and earthwork measures such as over-excavation and recompaction) and Mitigation Measure 4.6.3A would reduce impacts to less than significant.

- **Expansive Soils**. On-site Hanford coarse sandy loam exhibits low shrink-swell potential; the Certified EIR determined expansive-soil impacts to be less than significant (no specific mitigation required).

- **Septic/Alternative Wastewater Systems**. The approved project does not include septic or alternative wastewater disposal systems; the Certified EIR found no impact.

- **Paleontological Resources / Unique Geologic Feature.** The Certified EIR evaluates this topic in the cultural resources section, consistent with the Appendix G guidelines at the time. The Certified EIR determined that the project site is underlain by coarse late Pleistocene sediments, which are generally unsuitable for preserving significant fossils. Although the site lies within a region known for high paleontological sensitivity, the field survey conducted by a qualified paleontologist concluded that the on-site materials were too coarse to contain well-preserved specimens. Nevertheless, because fine-grained sediments of similar age elsewhere in the region have yielded fossils, impacts were considered potentially significant. Implementation of Mitigation Measure 4.5.2A, which requires paleontological monitoring and recovery if resources are encountered, reduced impacts to less than significant.

3.7.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:					
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	LTS	No	No	No	**Yes**
ii) Strong seismic ground shaking?	LTS/M	No	No	No	**Yes**
iii) Seismic-related ground failure, including liquefaction?	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
iv) Landslides?	LTS	No	No	No	**Yes**
b) Result in substantial soil erosion or the loss of topsoil?	LTS	No	No	No	**Yes**
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	LTS/M	No	No	No	**Yes**
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	LTS	No	No	No	**Yes**
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	NI	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	N/A	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based in part on the *Geotechnical Engineering Report* prepared by Terracon, dated May 7, 2024, and included in Appendix C.

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. Based on a review of the State Fault Hazard Maps, the nearest Alquist–Priolo Earthquake Fault Zone is adjacent to, but does not include, the project site (Appendix C). While the larger parcel boundaries extend near the mapped fault zone, the project site and its disturbance footprint are entirely outside the zone boundary. No active or potentially active faults are known to cross the project site. Therefore, impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR

under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

ii) Strong seismic ground shaking?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed in the Certified EIR, the project site is located in southern California, a seismically active region (Appendix C). The type and magnitude of seismic hazards affecting the site are dependent on the distance to causative faults, the intensity, and the magnitude of the seismic event. As calculated using the USGS Unified Hazard Tool, the Eureka Peak fault, which is considered to have the most significant effect on the site from a design standpoint, has a maximum credible earthquake magnitude of 6.47 and is located approximately 1.37 miles from the site. Probabilistic seismic hazard results from the USGS tool indicate that seismic shaking at the project site is predominantly associated with events of approximately magnitude 6.7 from regional fault sources. Although the project site and its area of disturbance are not located within an Alquist-Priolo Earthquake Fault, the project site would be subject to seismic ground shaking.

The proposed project would be required to comply with the seismic design parameters of the California Building Code (CBC), which regulates all building and construction projects and implements a minimum standard for building design and construction that includes specific requirements for seismic safety, evacuation, foundations, retaining walls, and site demolition. Additionally, the proposed project would adhere to the construction and design parameters as identified by the Geotechnical Report which includes but is not limited to, earthwork recommendations, foundation design recommendations, floor slab and pavement design parameters (Appendix C). Implementation of Mitigation Measure 4.6.1A of the Certified EIR, which has been modified for the proposed project, would continue to require adherence to the recommendations contained in the geotechnical investigation and adherence to the Town/State development code would reduce potential impacts associated with damage to structures caused by earthquake to a less than significant level.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

iii) Seismic-related ground failure, including liquefaction?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. Based on a review of the California Geological Survey map, the project site has not been mapped for liquefaction hazard (Appendix C), and according to the San

Bernadino County Geologic Maps, the site's potential for liquefaction hazard is low. Furthermore, based on the anticipated depth to groundwater, liquefaction hazard potential at the site is considered low. The proposed project would be designed and constructed to withstand liquefaction potential consistent with CBC and the geotechnical engineering report recommendations, thereby reducing impacts to less than significant, consistent with the approved project.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

iv) Landslides?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved project site, and as such, the proposed project would remain consistent with the Certified EIR's findings. As with the Certified EIR, no landslides have been documented in the Town, and the potential for landslides at the project site is very low because of site is flat . Therefore, with adherence with the CBC and the geotechnical engineering report recommendations, impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Result in substantial soil erosion or the loss of topsoil?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Erosion is a normal and inevitable geologic process whereby earthen materials are loosened, worn away, decomposed, or dissolved and removed from one place and transported to another. The project site contains relatively flat terrain, which decreases the project's potential to accelerate erosion. Implementation of the proposed project would require limited earthwork which include grading for proper base and slope for the fuel station and convenience store, and utility trenching.

As with the Certified EIR, because the proposed project encompasses an area of more than one acre, the proposed project would be subject to the NPDES permit requirements. These include the preparation of a SWPPP and implementation of best management practices that would describe minimum and advanced construction best management practices for erosion control at the site. Additionally, adherence with existing state and local laws regulating construction

activities would minimize soil erosion. Therefore, the proposed project would not result in substantial soil erosion or loss of topsoil, and impacts would remain less than significant impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is flat and, as discussed above in Impact 3.7 (a)(iv), has low susceptibility to landslides. The geotechnical engineering report concluded that the project site has a low liquefaction hazard (Appendix C). The proposed project would be designed consistent with the CBC and the geotechnical engineering report recommendations. Compliance with CBC and recommendations from the geotechnical engineering report would ensure that the proposed project would not result in or contribute to on- or off-site liquefaction and landslides.

The proposed project would excavate, scarify, moisture condition, and recompact on-site soils in areas to be developed, consistent with recommendations in the geotechnical investigation (Appendix C). With soil recompaction and adherence to the CBC and geotechnical recommendations, the potential for seismic settlement or lateral spreading would be minimal and not expected to result in significant impacts.

The proposed project would remain within the boundaries of the approved Specific Plan area, and as such, the proposed project would remain consistent with the Certified EIR's findings that no ground subsidence has occurred in the vicinity of the project site. Thus, impacts would remain less than significant.

Based on the results of a consolidation test, soils encountered on the site at depths of approximately 2.5 to 5 feet below ground surface exhibit negligible collapse potential under normal footing loads (Appendix C). Implementation of modified Mitigation Measure 4.6.1A of the Certified EIR, which replaces Mitigation Measure 4.6.3A of the Certified EIR, would reduce impacts associated with soil collapse to a less than significant level.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. As such, the proposed project would remain consistent with the approved project's findings that the site soils be subject to potentially significant impact associated with expansive soils. Implementation of modified Mitigation Measure 4.6.1A of the Certified EIR, which replaces Mitigation Measure 4.6.3A of the Certified EIR, would reduce impacts associated with expansive soils to a less than significant level.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As with the approved project, the proposed project does not propose the use of septic tanks or alternative wastewater disposal systems. No impacts related to septic systems would occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR of the approved project discussed paleontological resources in Section 3.5, *Cultural Resources*, and concluded that the project site's sediments are too coarse to preserve significant paleontological specimens.

Additionally, the proposed project would be developed on the existing Walmart Supercenter parking lot. Although paleontological resources are not expected to be encountered during project construction, it is possible that unknown paleontological resources could be discovered during grading activities. Implementation of Mitigation Measure 4.5.3A from the Certified EIR

would ensure that impacts to unknown paleontological resources are properly identified and protected. Further, the project site is fully developed and does not include any unique geologic features. Therefore, impacts would remain less than significant as previously, consistent with the conclusion of the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.7.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. The Certified EIR identified Mitigation Measures 4.5.3A, 4.6.1A, 4.6.2A, and 4.6.3A. Mitigation Measures 4.5.3A and 4.6.1A remain applicable to ensure impacts related to strong groundshaking and unstable soils are reduced to less than significant. Mitigation Measures 4.6.2A and 4.6.3A were previously incorporated into the approved project but have been removed from the proposed project's MMRP because they are duplicative of Mitigation Measure 4.6.1A, which already addresses those requirements.

Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and <u>underline</u> for new, inserted text

The Certified EIR Mitigation Measures 4.5.3A and 4.6.1A are reproduced below.

> **4.5.3A** Prior to grading activities, a paleontological resource monitoring plan shall be submitted for review and approved by the Town. The paleontological resource monitoring plan shall require monitoring of the upper ten (10) feet of topsoil. If after 100 percent of soils to five (5) feet below original grade has been monitored and no paleontological resources have been identified, the Project Paleontologist may discontinue monitoring. In the event that a paleontological resource is uncovered, discovered, or otherwise detected or observed during the course of grading or construction of the project, ground-disturbing activities within 50 feet of the find shall cease until the nature and extent of the find can be evaluated by a qualified paleontologist (meeting Secretary of Interior Standards). If any such resource uncovered during the course of project-related grading or construction, appropriate mitigation

measures, recordation, and removal procedures shall be required prior to any resumption of work in the affected area of the project.

4.6.1A The design and construction of the proposed on-site uses shall adhere to the recommendations identified in the geotechnical investigation prepared for the proposed project; ~~engineering standards detailed in the UBC for development within Seismic Zone 4;~~ and/or other design requirements established by the Town. The geotechnical investigation prepared for this project identifies the potential for some degree of structural damage during seismic shaking, but the risk can be reduced through recommendations contained in the geotechnical investigation. These design and construction measures, from the geotechnical investigation, shall include but are not limited to the following~~)~~:

- The proposed structures may be supported on shallow spread footing foundations bearing on engineered fill, or on drilled shafts. Engineered fill should extend to a minimum depth of 1 feet below the bottom of foundations, or the depth of undocumented fill, or 3 feet below existing grades, whichever is greater.
- The excavation should be widened laterally at least 8 inches for each 12 inches of fill placed below footing base elevations.
- Grading for the proposed station should incorporate the limits of the overexcavation plus a lateral distance of 1 feet beyond the outside edge of perimeter footings, where possible. Overexcavation and replacement is not required for support of drilled shaft foundations.
- It is recommend that the underground storage tanks be over-excavated by about 2 feet in plan area to provide adequate access around the excavation for underground storage tanks construction. The walls of the proposed excavation should be shored or sloped in conformance with OSHA excavation and trench safety standards. If any excavation is extended to a depth of more than 20 feet, it will be necessary to have the side slopes designed by a professional engineer.
- Onsite soils consist of cohesionless sandy soils. Therefore, OSHA Soil Type C should be utilized for sloping considerations and on-site soils shall be sloped at a minimum of 1.5H:1V.
- In areas where sidewalks or paving do not immediately adjoin the structure, it is recommend that protective slopes be provided with a minimum grade of approximately 5 percent for at least 10 feet from perimeter walls.
- To reduce the potential for damage caused by movement, we recommend:
    - minimizing moisture increases in the backfill;

- controlling moisture-density during placement of backfill;
- using designs which allow vertical movement between the exterior features and adjoining structural elements;
- placing effective control joints on relatively close centers

- ~~To minimize post-construction soil movement and provide a uniform support for the buildings, overexcavation and recompaction within the proposed footings shall be performed to a minimum depth of 3 feet below existing grades or 2 feet below the bottom of the proposed footings, whichever is deeper.~~
- ~~The overexcavation and recompaction within the interior slab-on-grade areas shall be performed to a depth of 2 feet below existing grades or 1 foot below the bottom of the proposed slab sections, whichever is deeper.~~
- ~~The overexcavation and recompaction shall also extend laterally 10 feet beyond the edges of the proposed footings.~~
- ~~Within the proposed exterior flatwork and pavement areas, overexcavation and recompaction shall be performed to at least 12 inches below existing grade or finish grade, whichever is lower.~~
- ~~Prior to placement of fill soils, the upper 8 inches of native soils shall be scarified, moisture-conditioned to near optimum moisture content, and recompacted to a minimum of 95 percent of maximum dry density based on ASTM D1557 Test Method.~~
- ~~The proposed structures shall be supported on a shallow foundation system bearing on at least 2 feet of engineered fill.~~
- ~~Shoring or sloping back trench sidewalls shall be required within these sandy soils.~~
- ~~The proposed structure footings shall be designed utilizing an allowable bearing pressure of 2,500 pounds per square foot (psf) for dead-plus-live loads. Footings should have a minimum depth of 18 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is deeper~~

~~**4.6.2A** The design and construction of the proposed on-site uses shall adhere to the recommendations identified in the geotechnical investigation prepared for the proposed project. The geotechnical investigation prepared for this project identifies the potential for some degree of soil settlement, but the risk can be reduced through adherence to recommendations contained in the geotechnical investigation. These design and construction measures, from the geotechnical investigation, shall include the following:~~

- ~~To minimize post-construction soil movement and provide a uniform support for the building, overexcavation and recompaction within the proposed footings shall be performed to a minimum depth of 3 feet below existing grades or 2 feet below the bottom of the proposed footings, whichever is deeper.~~
- ~~The overexcavation and recompaction within the interior slab-on-grade areas shall be performed to a depth of 2 feet below existing grades or 1 foot below the bottom of the proposed slab sections, whichever is deeper.~~
- ~~The overexcavation and recompaction shall also extend laterally 10 feet beyond the edges of the proposed footings.~~
- ~~Within the proposed exterior flatwork and pavement areas, overexcavation and recompaction shall be performed to at least 12 inches below existing grade or finish grade, whichever is lower.~~

~~**4.6.3A** The design and construction of the proposed on-site uses shall adhere to the recommendations identified in the geotechnical investigation prepared for the proposed project, which identifies the potential for some degree of post-construction settlement. The risk can be reduced through adherence to recommendations contained in the geotechnical investigation. Theserecommendations include (but shall not be limited to) the following:~~

- ~~Prior to the placement of fill soils, the upper 8 inches of native soils shall be scarified, moisture-conditioned to near optimum moisture content and recompacted to a minimum of 95 percent of maximum dry density based on ASTM D1557 Test Method.~~
- ~~Native silty sand or silty sand soils/sand soils are suitable for reuse as engineered fill. Fill material shall be compacted to a minimum of 95 percent of maximum density based on ASTM D1557 Test Method.~~

3.8 GREENHOUSE GAS EMISSIONS

3.8.1 Summary of Impacts Identified in the Approved Project

The Certified EIR analyzed consistency of the approved project with GHG reduction strategies that would reduce GHG emissions, but did not include quantitative analysis under defined thresholds, which were not available at the time the Certified EIR was prepared. The Certified EIR acknowledges that although these strategies may reduce GHG emissions, it was not possible at that time to quantify reductions in GHG emissions. However, the approved project was found

to be consistent with reduction strategies. As a result, the approved project's GHG emissions impact were found to be less than significant.

3.8.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	N/A	No	No	No	**Yes**
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	N/A	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based on the *Air Quality and Greenhouse Gas EIR Addendum Analysis Memorandum* prepared by Kimley-Horn and Associates Inc. dated August 27, 2025, and included in Appendix A.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. GHG emissions of the proposed project are compared to MDAQMD's brightline GHG threshold

of 100,000 short tons of CO_2e (carbon-dioxide equivalence) or approximately 90,718 metric tons of CO_2e ($MTCO_2e$).

CONSTRUCTION GHG EMISSIONS

The proposed project would result in direct emissions of CO_2, N_2O, and CH_4 (methane) from construction equipment and the transport of materials and construction workers to and from the project site. The GHG emissions would only occur during temporary construction activities and would cease once construction is complete. The total GHG emissions generated during the construction of the proposed project are shown in Table 7**,** *Project Construction–Related Greenhouse Gas Emissions.* As shown in Table 7, the proposed project would result in the generation of approximately 102 $MTCO_2e$ throughout the course of construction. The amortized project construction emissions would be 3 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

Table 7 Project Construction–Related Greenhouse Gas Emissions

Category	$MTCO_2e$
Total Construction Emissions	102

Source: Kimley-Horn 2025a (Appendix A).

OPERATIONAL GHG EMISSIONS

Operational emissions occur over the life of a project. GHG emissions would result from direct emissions such as project-generated vehicular traffic including passenger automobiles and trucks, and from indirect sources such as off-site generation of electrical power, the energy required to convey water and wastewater to and from the proposed project, the emissions associated with solid waste generated from the proposed project, and any fugitive refrigerants from air conditioning or refrigerators. GHG emissions associated with the proposed project are summarized in Table 8, *Proposed Project Operational Greenhouse Gas Emissions.* Construction GHG emissions have been amortized over a 30-year period and added to the total operational emissions of a project to ensure that GHG reduction strategies address construction emissions as part of the overall operation.

As shown in Table 8, the proposed project would generate 1,960 $MTCO_2e$ of GHG emissions, which is less than the 2,351 $MTCO_2e$ assumed for the fuel station component of the approved project. As noted above, GHG emissions for the fuel station component of the approved project were calculated using 2010 emission rates in CalEEMod. These emissions, therefore, do not incorporate the stricter vehicle fuel emissions standards and energy efficiency requirements required for current development.

Table 8 Proposed Project Operational Greenhouse Gas Emissions

Source	Emissions ($MTCO_2e$ per Year)
Approved Project	
Fuel Station Operational Emissions	2,351
Proposed Project	
Construction Amortized Over 30 Years	3
Mobile Sources	1,886
Area Source	<1
Energy	17
Water and Wastewater	<1
Solid Waste	1
Refrigerants	53
Total	**1,960**
MDAQMD Threshold	*90,718*
Exceed MDAQMD Threshold?	**No**

Source: Kimley-Horn 2025a (Appendix A).

As discussed previously, the Certified EIR was prepared before MDAQMD had adopted the 100,000 short ton threshold (90,718 $MTCO_2e$). Instead, the Certified EIR based GHG impacts on consistency with GHG reduction strategies that would reduce GHG emissions. However, these GHG reduction strategies are now required under the CARB Scoping Plan. Additionally, the proposed project would be subject to the California Building Energy Efficiency Standards and Green Building Standards Code (CALGreen), further minimizing building energy emissions. Improvements in vehicle fuel efficiency under the federal Corporate Average Fuel Economy regulations would also result in lower mobile source emissions from the proposed project over time.

Because the proposed project is subject to current regulations enforcing stricter emissions reductions compliance when compared to those applicable to the approved project, emissions under the proposed project would generally be less than those of the approved project. As shown in Table 8, the proposed project would generate less emissions than the approved project and less than MDAQMD's current GHG threshold. Therefore, impacts related to GHG emissions would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects, would not substantially increase the severity of previously identified significant effects, and therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As noted, GHG impacts under the Certified EIR were assessed by determining the approved project consistency with relevant GHG reduction strategies. Like the approved project, the proposed project would be required to comply with applicable Statewide and local regulations requiring the reduction of GHG emissions. The strategies listed in Table 4.3-Q of the Certified EIR are now largely integrated with CARB's Scoping Plan. Therefore, though the Certified EIR did not explicitly analyze the approved project's consistency with the Scoping Plan, an analysis of the proposed project's consistency with the Scoping Plan is comparable to the analysis in Table 4.3-Q of the Certified EIR.

The latest 2022 Climate Change Scoping Plan outlines the State's strategies to reduce GHG emissions in accordance with the targets established under Assembly Bill (AB) 32, Senate Bill (SB) 32, and AB 1279 (CARB 2022). The Scoping Plan is applicable to State agencies and is not directly applicable to cities/counties and individual projects. However, new regulations adopted by the state agencies from the Scoping Plan result in GHG emissions reductions at the local level. As a result, local jurisdictions benefit from reductions in transportation emissions rates, increases in water efficiency in the building and landscape codes, and other statewide actions that affect a local jurisdiction's emissions inventory from the top down. Statewide strategies to reduce GHG emissions include the Low Carbon Fuel Standard and changes in the corporate average fuel economy standards (e.g., Pavley I and Pavley California Advanced Clean Cars program).

GHG emissions generated by future development facilitated by the proposed project would be reduced through compliance with the programs and regulations identified by the Scoping Plan and implemented by state, regional, and local agencies to achieve the statewide GHG reduction goals of AB 32, SB 32, and AB 1279. Thus, the proposed project would not conflict with the above statewide strategies identified to implement the CARB 2022 Scoping Plan.

Consequently, the proposed project would not result in new significant environmental effects, would not substantially increase the severity of previously identified significant effects, and therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.8.3 Adopted Mitigation Measures Applicable to the Proposed Project

The Certified EIR determined that GHG emissions impacts would be less than significant. Therefore, no mitigation measures specific to GHG emissions were incorporated in the Certified EIR. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.9 HAZARDS AND HAZARDOUS MATERIALS

3.9.1 Summary of Impacts Identified in the Approved Project

- **Routine Transport, Use, and Disposal of Hazardous Materials**. The Certified EIR determined that the approved project would involve the routine transport, use, and storage of hazardous materials associated with large-scale retail operations, including the handling of pesticides, fertilizers, and other household hazardous substances. With compliance with these regulations, impacts were found to be less than significant. (Note: fuel sales were not an approved Specific Plan use.)

- **Accidental Release or Upset Conditions**. The Certified EIR evaluated the potential for accidental spills or upset conditions and determined that adherence to hazardous-materials business-plan requirements, spill-containment standards, and emergency-response protocols would ensure impacts remain less than significant.

- **Hazardous-Materials Sites and Proximity to Schools**. The Certified EIR identified no schools within one-quarter mile of the project site and found that the site is not listed on the Cortese List or in other hazardous-materials databases. A Phase I ESA confirmed no evidence of contamination or storage of hazardous substances. Impacts related to hazardous-materials sites or proximity to schools were determined to be less than significant.

- **Emergency Response and Evacuation Plans**. The Certified EIR found that development of the approved project would not impair or conflict with adopted emergency-response or evacuation plans. Site design would comply with emergency-access standards, and construction traffic-control measures would maintain access during temporary restrictions. Impacts were therefore less than significant.

- **Airport Hazards**. The project site is located approximately one mile from the Yucca Valley Airport, within Safety Review Area 3, where commercial uses are considered compatible. The Certified EIR concluded that aviation-safety risks would be less than significant.

- **Wildland Fire Hazards**. The Certified EIR found that the project site is not in or adjacent to wildlands and determined no impact related to wildland-fire hazards.

3.9.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	LTS	No	No	No	**Yes**
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	LTS	No	No	No	**Yes**
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	LTS	No	No	No	**Yes**
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	LTS	No	No	No	**Yes**
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	NI	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Development under the proposed project would continue to involve the routine transport, use, and storage of hazardous materials associated with large-scale retail and fueling operations, consistent with the approved project analyzed in the Certified EIR. The approved project included a six-pump fuel station with a canopy, and the proposed project would maintain this fueling configuration in a slightly modified on-site location. The proposed project also includes construction of a new convenience store adjacent to the fuel station, which was not previously analyzed in the Certified EIR.

Operation of the convenience store would involve the limited use and storage of typical consumer products such as cleaning supplies, batteries, automotive fluids, and other household materials. These substances would be handled, stored, and disposed of in accordance with applicable federal, State, and local regulations governing hazardous materials management, including the U.S. Department of Transportation, California Department of Toxic Substances Control, and the San Bernardino County Fire Department Hazardous Materials Division.

The addition of the convenience store would not substantially increase the volume or type of hazardous materials used or stored on the project site. All fueling operations would continue to

comply with underground storage tank permits, hazardous materials business plan regulations, and ongoing inspection by the County Fire Department. Therefore, consistent with the Certified EIR, impacts related to the routine transport, use, and disposal of hazardous materials would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Under the proposed project, the six-pump fuel station would be regulated under the same requirements as the approved project, and the convenience store would not materially increase the likelihood or magnitude of spill events. All fuel dispensing and storage systems would continue to comply with UST design, secondary containment, and monitoring requirements under California Code of Regulations Title 23, Division 3, Chapter 16.

Although the fuel station would be repositioned within the boundaries of the approved Specific Plan area, the relocation would not increase environmental risk because the same containment, inspection, and emergency response standards would apply. Therefore, impacts related to accidental spills or upset conditions would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that no schools were located within one-quarter mile of the project site. A review of current aerial imagery and district boundaries confirms that no schools have been developed within that radius since EIR certification. The nearest school is Black Rock High School, approximately 0.7 mile southeast of the project site. Therefore, the proposed project would not pose a risk of hazardous emissions or accidental release to nearby schools, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR concluded that the approved project was not included on any list of hazardous materials sites compiled pursuant to Government Code § 65962.5, and that a Phase I Environmental Site Assessment identified no evidence of hazardous materials contamination. A review of the California Department of Toxic Substances Control's EnviroStor database (accessed October 2025) confirms that the project site remains absent from the list of hazardous waste facilities, cleanup sites, or active investigations (DTSC 2025). Therefore, no change in environmental conditions has occurred since certification of the EIR, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is located approximately one mile west of Yucca Valley Airport, within Safety Review Area 3, where commercial uses are considered compatible. The proposed project would not increase building heights or introduce sensitive uses from what was analyzed in the Certified EIR that could interfere with airport operations. Accordingly, impacts related to airport hazards would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the

criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR concluded that the approved project would not impair implementation of, or conflict with, an adopted emergency response or evacuation plan. The proposed project would not modify site access, circulation, or driveway locations in a way that would impede emergency vehicle movement. Compliance with applicable fire and building code requirements would ensure continued emergency access. Therefore, impacts would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR found that the Specific Plan area is not located in or adjacent to wildlands. The project site remains surrounded by developed land and paved roadways, and the proposed project would not change this condition. Therefore, impacts related to wildland fire hazards would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.9.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were identified in the Certified EIR for Hazards and Hazardous Materials. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.10 HYDROLOGY AND WATER QUALITY

3.10.1 Summary of Impacts Identified in the Approved Project

- **Construction-Related Water Quality Impacts**. The Certified EIR found that grading and excavation during construction could expose soils to storm runoff, causing erosion and sedimentation. Compliance with the NPDES CGP preparation of a SWPPP, and implementation of BMPs—including inspection and monitoring requirements under oversight of the CRRWQCB—would ensure construction-related water quality impacts remain less than significant.

- **Operational Water Quality Impacts**. The Certified EIR determined that development would increase impervious surfaces and urban runoff pollutants associated with vehicular traffic and paved areas. However, with implementation of operational BMPs, on-site drainage design consistent with Town and County stormwater standards, and compliance with NPDES operational requirements, impacts to stormwater quality would remain less than significant.

- **Groundwater Recharge and Supply**. The Certified EIR found that the conversion of permeable surfaces to impervious area would slightly reduce groundwater recharge but not at a level significant to the Warren Valley Groundwater Basin. The basin is adjudicated and managed by the Hi-Desert Water District (HDWD) and Mojave Water Agency (MWA) under the Warren Valley Basin Judgment. Compliance with basin management policies and reliance on imported water to maintain balance ensured impacts to groundwater supply and recharge were less than significant.

- **Drainage Pattern and Capacity**. The Certified EIR concluded that increases in runoff from impervious surfaces would be minor relative to total rainfall. The approved project's drainage system—including catch basins, storm drains, and a detention basin—was designed to ensure post-development flows would not exceed predevelopment levels. Therefore, impacts related to drainage pattern alteration and system capacity were less than significant.

- **Flooding and Flood Hazard**. The Certified EIR determined that the site is located in FEMA Flood Zone X, outside the 500-year floodplain, and is not within a dam inundation area. The project would not impede or redirect flood flows; thus, flooding impacts were less than significant.

- **Seiche, Tsunami, or Mudflow Risk**. The Certified EIR found no nearby large bodies of water or steep slopes capable of generating seiche, tsunami, or mudflow hazards. Related impacts were therefore less than significant.

- **Waste Discharge and Treatment**. The Certified EIR evaluated on-site wastewater treatment under the jurisdiction of the Colorado River Basin RWQCB and found it would meet applicable water quality objectives. Installation of dry sewer lines and future connection to the HDWD wastewater treatment facility would ensure compliance with future NPDES requirements. Impacts were determined to be less than significant.
- **Consistency with Water Quality and Groundwater Management Plans**. The Certified EIR determined the project would comply with applicable RWQCB Basin Plan policies, HDWD requirements, and Town NPDES standards. The proposed project would not conflict with or obstruct the implementation of any water quality control plan or sustainable groundwater management plan. Impacts were less than significant.

3.10.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based on the *Mojave River Watershed Water Quality Management Plan* prepared by Kimley-Horn and Associates Inc. dated September 8, 2025, included in Appendix D.

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

CONSTRUCTION

Consistent with the Certified EIR, construction of the proposed project would disturb greater than one acre and therefore has the potential to discharge sediment and pollutants to storm drains and receiving waters. The proposed project would be required to obtain a State Water Resources Control Board NPDES Construction General Permit. The Colorado River Regional Water Quality Control Board (CRRWQCB) administers the NPDES permitting programs for the Town of Yucca Valley and is responsible for developing waste discharge requirements. CRRWQCB requirements include those requiring preparation and implementation of water quality management plan (WQMP) to control contaminants into storm drain systems, educate the public about stormwater impacts, detect and eliminate illicit discharges, control runoff from construction sites, and implement BMPs and site-specific runoff controls and treatments. The NPDES Construction General Permit (CGP) and preparation of a SWPPP would include BMPs to reduce water quality impacts, including various measures to control on-site erosion, reduce sediment flows into stormwater and wind erosion; reduce tracking of soil and debris into adjacent roadways and off-site areas; and manage wastes, materials, wastewater, liquids, hazardous materials, stockpiles, equipment, and other site conditions to prevent pollutants from entering the storm drain system. Therefore, consistent with the Certified EIR, implementation of the provisions of the NPDES permits and compliance with Town grading requirements would reduce impacts to water quality or water discharge to a less than significant level.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

OPERATION

During operation, the proposed project would connect to the existing on-site drainage network previously analyzed in the Certified EIR. Stormwater from paved areas, including the fueling canopy and convenience-store area, would continue to be routed to the existing detention basin, with pretreatment of flows from fuel areas through the Aqua-Swirl AS-2 separator.

As detailed in the WQMP, non-structural BMPs (e.g., employee training, spill-response procedures, catch-basin inspections, litter control) and structural BMPs (e.g., covered trash enclosure, signage, graded landscaped areas, and efficient irrigation) would be implemented and maintained by Walmart Stores, Inc. to ensure long-term water-quality protection (Appendix D). The WQMP determined that the proposed conditions would not increase stormwater

volumes or degrade the quality of runoff compared to existing conditions because the project introduces additional pervious landscaping and maintains existing flow direction toward the detention basin (Appendix D).

With adherence to the CRRWQCB and NPDES operational requirements, implementation of BMPs identified in the WQMP, and routine inspection and maintenance, the project would not violate water-quality standards or waste-discharge requirements, nor substantially degrade surface or groundwater quality. Therefore, impacts would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area, and as such, would not result in additional impacts to groundwater supplies or recharge. As discussed in the Certified EIR, the approved project's development resulted in conversion of previously undeveloped land to commercial use with associated impervious surfaces. The proposed project would occur entirely within the existing Walmart Supercenter parking lot, which has already been developed and graded, and therefore would not result in a net increase in impervious area compared to the approved project.

The proposed project would also incorporate new landscaped areas and bioretention planters, which would provide small, localized opportunities for infiltration and groundwater recharge. No direct extraction of groundwater or new water wells are proposed. The proposed project would continue to receive water from the Hi-Desert Water District, which obtains its supply from the Warren Groundwater Basin, managed under the Sustainable Groundwater Management Act (SGMA).

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in a substantial erosion or siltation on- or off-site;

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. During construction, preparation and implementation of site-specific BMPs consistent with the CGP and the proposed project's SWPPP would control sediment and prevent pollutants from entering waterways and receiving waters.

The proposed project would remain within the boundaries of the approved Specific Plan area. As discussed above, the proposed project would not increase impervious surfaces compared to the approved project and would introduce a slight increase in pervious areas through landscaped planters and bioretention features identified Appendix D. All project site drainage would be directed to existing catch basins connected to the on-site detention basin located north of the Walmart parcel, with pretreatment of fuel area runoff through an Aqua-Swirl AS-2 hydrodynamic separator before discharge to the basin.

Because the project site is already paved, essentially flat, and lacks natural drainage channels, the potential for erosion or siltation during operation would be minimal. The Certified EIR found that on-site drainage improvements, including detention basins and compliance with Town and County storm-drain design standards, would prevent substantial erosion or siltation on or off the site. Therefore, incorporation of the same structural BMPs and site design measures required under the current NPDES permit would ensure that erosion and siltation impacts remain less than significant, consistent with the Certified EIR conclusions and the 2025 WQMP findings.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

As with the approved project, during construction, the proposed project would implement BMPs consistent with the CGP and the site-specific SWPPP to ensure that temporary stormwater flows do not result in flooding or exceedance of stormwater drainage system capacity.

As discussed above, the proposed project would not result in an increase in previous surfaces and therefore would not increase the rate or amount of surface runoff during operation. Stormwater flows from the proposed project would continue to be captured by existing on-site catch basins, conveyed through the established storm drain network, and directed to the existing detention basin constructed as part of the approved project.

The Certified EIR determined that the detention basin and drainage infrastructure designed under the approved project provided sufficient capacity to accommodate project-area runoff without increasing off-site flows or flooding potential. The 2025 WQMP confirms that the proposed project would maintain this drainage pattern, directing all runoff (including from the new fueling canopy) to the same detention system, with pretreatment via an Aqua-Swirl AS-2 hydrodynamic separator.

Additionally, the proposed project would implement site design, source control, and treatment-control BMPs in accordance with the NPDES permit and Town drainage standards. Therefore, impacts related to surface runoff and on- or off-site flooding would remain less than significant, consistent with the Certified EIR and WQMP findings.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that with the construction of on-site catch basins, storm drains, and a detention basin, post-development runoff rates would remain at or below pre-development conditions, thereby preventing exceedance of drainage capacity.

As discussed above, the proposed project would not result in an increase in impervious surfaces as compared to the approved project and therefore would not increase runoff volume or flow rate that would exceed the capacity of the approved project's stormwater drainage systems. Water flows from the proposed project would continue to be captured by existing on-site inlets and catch basins, conveyed through the approved project's underground storm drain network, and directed to the existing detention basin constructed under the Certified EIR, with limited surface flow conveyed along private drive aisles and the adjacent public right-of-way drainage facilities. With the decrease in impervious surfaces, it is expected stormwater flows would remain similar or less than flows analyzed in the approved project.

The WQMP confirms that the fueling facility would maintain this existing drainage configuration and that total runoff discharge from the site would not exceed design capacity. In addition, pretreatment of fuel area runoff through an Aqua-Swirl AS-2 hydrodynamic separator and implementation of source-control and treatment BMPs required under the NPDES permit would prevent substantial pollutant discharges. Therefore, impacts related to storm drain capacity or polluted runoff would remain less than significant, consistent with the Certified EIR and WQMP findings.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

iv) impede or redirect flood flows?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined the Specific Plan area is not within a designated flood hazard area or dam inundation area. The approved project site is within flood Zone X, an area outside the 500-year floodplain.

The proposed project would remain entirely within the boundaries of the approved Specific Plan area and would not modify the existing drainage pattern or detention basin designed under the Certified EIR. Therefore, the proposed project would not have the potential to impede or redirect flood flows, and impacts would remain less than significant, consistent with the Certified EIR and WQMP findings.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164.

The Certified EIR determined the Specific Plan area is not within an identified flood hazard area, dam inundation area, tsunami, or seiche area. The approved project site is within flood Zone X, which is defined as an area outside the 500-year floodplain. The project site is not within the vicinity of any lakes or bodies of water and would not be subject to seiche- or tsunami-related flooding.

The proposed project would remain within the boundaries of the approved Specific Plan area and would not introduce any new risk of pollutant release due to inundation. Therefore, impacts remain less than significant and consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR noted that the project would construct an on-site treatment system or underground treatment system involving several chambers and pumps, which would be consistent with the CRRWQCB Water Quality Objectives. However, the approved project does not discuss the water quality control plan or sustainable groundwater management plan.

Water quality in surface and groundwater bodies is regulated by the State Water Resources Control Board and the RWQCB. The Town of Yucca Valley is under the jurisdiction of the CRRWQCB, which is responsible for implementation of state and federal water quality protection guidelines in the vicinity of the project site. The CRRWQCB implements the Water Quality Control Plan for the Colorado River Basin (Basin Plan), a master policy document for managing water quality issues in the region. Additionally, the project site is within the Warren Valley Basin, with management of the basin written in the Warren Valley Basin Management Plan (WVBW 1991).

As discussed in Thresholds 3.10.2 (a), (b), and (c), the proposed project would adhere to CRRWQCB requirements and not obstruct the implementation of a water quality control plan or sustainable groundwater management plan. The proposed project would be required to implement a SWPPP during construction to reduce potential impacts to surface water and comply with the Town's NPDES standards and Town Code. The proposed project would not adversely affect water quality or groundwater quality. Therefore, implementation of the proposed project would not conflict with or obstruct implementation of any water quality control plan and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.10.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to hydrology and water quality. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.11 LAND USE AND PLANNING

3.11.1 Summary of Impacts Identified in the Approved Project

- **Physically Divide an Established Community**. The Certified EIR found that the Specific Plan area did not contain any existing housing or neighborhood features and was undeveloped at the time of analysis. The site is not located within an established community and would not create physical barriers between existing residential areas. Therefore, impacts related to the division of an existing community were determined to be less than significant.

- **Conflict with Applicable Land Use Plans, Policies, or Regulations**. The Certified EIR determined that the approved project was consistent with the Town of Yucca Valley General Plan, Development Code, and Specific Plan, all of which guide local land use and development. The Certified EIR concluded that the approved project would not conflict with any land-use plan, policy, or regulation adopted for the purpose of avoiding or mitigating environmental effects, and impacts were less than significant.

3.11.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Physically divide an established community?	LTS	No	No	No	**Yes**
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Physically divide an established community?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. The project site does not currently, nor did it previously, contain any housing that constitutes part of a community or neighborhood. The project site is currently developed as the Walmart Supercenter parking lot. Therefore, no impact would occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project includes an amendment to the Specific Plan; however, the fuel station was evaluated in the Certieid EIR and this amendment functions to align the Specific Plan with the proposed fuel station and convenience store. Therefore the proposed project does not introduce a conflict with applicable land use regulations. The proposed project would remain generally consistent with the approved project as a six-pump fuel station with a canopy; however, it would include construction of a convenience store not previously analyzed under the approved project. The proposed convenience store is an allowed use subject to a CUP, which would undergo review and approval by the Town. The Specific Plan amendment updates the applicable land use regulations to allow the proposed fuel station and convenience store, and the CUP provides the discretionary mechanism for the Town to ensure the use complies with all development and operational standards. The inclusion of the convenience store would remain consistent with the Town's General Plan goals and policies, such as Policy 4, by providing additional employment opportunities. The proposed project would comply with the Town Development Code and the Specific Plan goals, policies, and design guidelines. Therefore, as identified in the Certified EIR, adherence to the goals and policies of the Town General Plan, Development Code, and the Yucca Valley Retail Center Specific plan would ensure consistency, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.11.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to land use and planning. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.12 MINERAL RESOURCES

3.12.1 Summary of Impacts Identified in the Approved Project

- **Loss of Statewide or Regional Mineral Resources.** The Certified EIR of the approved project determined no impact would occur to mineral resources of statewide or regional importance. The project site is not located within an area identified by the California Department of Mines and Geology as having substantial mineral resources. In addition, the Town's General Plan does not identify any aggregate extraction areas within the limits of the project site or in the vicinity.
- **Loss of Locally Important Mineral Resources.** The Certified EIR determined that the approved project would result in no impact to the availability of a locally important mineral resource recovery site delineated on a local plan. The Town's General Plan does not identify any aggregate extraction areas or extraction of mineral resources within the limits of the project site.

3.12.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the state?	NI	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	NI	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the state?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would remain within the boundaries of the approved Specific Plan area. As such, the proposed project would remain consistent with the Certified EIR's findings and would not impact any mineral resources of statewide or regional importance. Because no changes in physical location are proposed, the proposed project would result in no impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed in Section 3.12.2(a), since there are no physical changes in location proposed, the proposed project would remain within the boundaries of the approved Specific Plan area and

not impact any known local important mineral resources. Therefore, the proposed project would have no impact on locally important mineral resources.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.12.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to mineral resources. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.13 NOISE

3.13.1 Summary of Impacts Identified in the Approved Project

- **Construction and Operational Noise**. The Certified EIR determined that construction activities such as grading and building could generate noise levels up to 91 dBA Lmax at 50 feet, and up to 81 dBA Lmax at the nearest residences approximately 150 feet away. Even with implementation of Mitigation Measure 4.11.1A, construction noise impacts were found to be significant and unavoidable.

  Operational noise sources, including the auto service center, truck deliveries, parking lot activities, rooftop HVAC systems, and drive-through speaker systems, were determined to be below applicable exterior and interior noise standards or masked by existing ambient conditions. Implementation of Mitigation Measures 4.11.3A and 4.11.3B, which restrict nighttime loading and unloading, reduced operational noise impacts to less than significant.

  Traffic noise generated by the approved project was found to increase by less than 3 dBA and to remain within the Town's 70 dBA CNEL (residential) and 75 dBA CNEL (commercial) standards. Therefore, traffic-related noise impacts were determined to be less than significant.

- **Groundborne Vibration and Groundborne Noise**. The Certified EIR determined that vibration from construction equipment, such as bulldozers and compactors, would range from 70 to 75 VdB at 25 feet and would not exceed the FTA's 72 VdB annoyance threshold at nearby residences. These vibration levels would not cause structural damage or human

annoyance. As a result, vibration impacts were determined to be less than significant, and no mitigation measures were required.

- **Exposure to Airport Noise**. The Certified EIR concluded that the project site is located approximately one mile east of the Yucca Valley Airport and outside the 60 CNEL contour line. The site is within Safety Review Area 3, where commercial land uses are considered compatible with airport operations. Therefore, the project would not expose people working or residing in the project area to excessive noise levels, and impacts were determined to be less than significant.

3.13.2 Impacts Associated with the Proposed Project

Would the project result in:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	SU	No	No	No	**Yes**
b) Generation of excessive groundborne vibration or groundborne noise levels?	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

The analysis in this section is based on the *Noise EIR Addendum Analysis Memorandum* prepared by Kimley-Horn and Associates Inc. dated August 27, 2025, and included in Appendix E.

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that construction noise impacts would be significant and unavoidable under the approved project even with incorporation of Mitigation Measure 4.11.1A. Operational noise impacts were determined to be less than significant with incorporation of Mitigation Measures 4.11.3A and 4.11.3B, which reduced noise levels associated with loading and unloading activities. Traffic noise impacts were considered less than significant without mitigation.

CONSTRUCTION NOISE

Project construction is anticipated to occur over approximately 5 months and is scheduled to begin in 2025 and be completed in 2026.[4] Construction of the proposed project would commence with demolition of an area of the existing surface parking lot, followed by grading and excavation. Building foundations would then be constructed, followed by building construction, paving/concrete installation, and architectural coatings. Construction delivery/haul trucks would generally travel between the project site and SR-62.

Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g., land clearing, grading, excavation, paving). Noise generated by construction equipment, including earth movers, material handlers, and portable generators, can reach high levels. During construction, exterior noise levels could affect the residential neighborhoods near the construction site. However, it is acknowledged that construction activities would occur throughout the project site and would not be concentrated at a single point near sensitive receptors.

Construction activities would include demolition of the existing parking lot area, site preparation, grading, building construction, paving, and architectural coating. Such activities could require concrete saws, tractors, and dozers during demolition; graders, dozers and tractors during site preparation; graders, dozers, and tractors during grading; cranes, generators, tractors, forklifts, and welders during building construction; pavers, rollers, tractors, and a concrete mixer during paving; and air compressors during architectural coating. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 to 4 minutes at lower power settings.

The construction noise analysis in the Certified EIR assumed a numeric threshold when determining construction noise impacts. The Certified EIR assumed an exterior construction noise the noise threshold for of 75 dBA L_{max} during the day (7:00 am to 10:00 pm) and 70 dBA L_{max} standard during the night (10:00 pm to 7:00 am). The Certified EIR stated that the nearest residences to the approved project boundary may be subject to short-term and intermittent, maximum noise levels reaching 81 dBA L_{max} and would potentially result in annoyance, resulting in a significant impact requiring mitigation. Table 9, *Project Construction Noise Levels*, for the proposed project, shows that the maximum noise level of construction equipment at the nearest sensitive receptor would be 73.7 dBA L_{max}, which is lower than the construction noise levels of the approved project. Construction of the proposed project would also generate noise

[4] A conservative worst-case construction timeline has been modeled for air quality and greenhouse gas analysis purposes. This construction schedule has been included in the noise analysis for consistency.

levels less than the Town's exterior noise standard of 75 dBA L_{max} during the day. Construction is prohibited during the nighttime, and therefore the 70 dBA L_{max} standard during the night would not be exceeded. As a result, the proposed project construction noise would result in a less than significant impact.

Table 9 Project Construction Noise Levels

Construction Phase	Land Use	Direction	Distance to Property Line (feet)[1]	Average Distance (feet)[1]	Worst Case Modeled Exterior Noise Level (dBA L_{max})[1]	Worst Case Modeled Exterior Noise Level (dBA L_{eq})[1]
Demolition	Residential	North	410	535	73.7	68.2
Site Preparation	Residential	North	410	535	69.4	65.5
Grading	Residential	North	410	535	70.7	66.7
Building Construction	Residential	North	410	535	68.9	64.5
Paving	Residential	North	410	535	68.4	64.1
Architectural Coating	Residential	North	410	535	59.4	55.4

Source: Kimley-Horn 2025c (Appendix E)

Notes:

1. To conservatively estimate construction noise, the loudest equipment is assumed to operate nearest to the property line of the closest sensitive receptors. All other equipment is distributed evenly between the property line and an average distance, with loudest equipment located nearest to sensitive receptors and quieter equipment further away.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

OPERATIONAL NOISE

Fuel Station and Parking Lot Activities

The Certified EIR determined that operational noise from the approved project, including the fuel station, would be less than significant. However, the Certified EIR analysis did not provide noise levels for the fuel station only; as a result, this noise analysis will use the noise levels identified as parking lot activities in the Certified EIR. The noise levels from parking lot activities

would be comparable to fuel station noise levels because they include similar activities (i.e., car door slamming, car radios, engine start-up, and car pass-by). The Certified EIR noted that these activities would generate approximately 60 dBA L_{max} at 50 feet. The nearest sensitive receptor would be approximately 466 feet from the proposed fuel station refuel area. At this distance, the fuel station noise would attenuate to 40.6 dBA L_{max}, which is lower than the Town's exterior noise standards of 75 dBA L_{max} during the day and 70 dBA L_{max} standard during the night. As a result, fuel station noise levels would result in a less than significant impact.

Truck Movements

The Certified EIR determined that slow moving trucks would generate noise levels of up to 75 dBA L_{max} when traveling and braking at a distance of 50 feet. The nearest sensitive receptor would be approximately 466 feet from the proposed fuel station refuel area. At this distance, the noise generated by tanker trucks delivering fuel would attenuate to 55.6 dBA L_{max} and would result in a less than significant impact.

Other Noise-Generating Activities

The Certified EIR stated that buildings withing the approved project would have rooftop heating, ventilating, and air conditioning (HVAC) mechanical equipment. The Certified EIR states that rooftop HVAC units generate noise levels of approximately 52 dBA at a distance of 50 feet. Based on the site plan, the convenience store associated with the fueling station would be approximately 626 feet from the nearest sensitive receptor. At this distance, the noise generated by the rooftop HVAC unit would attenuate to 30 dBA and would result in a less than significant impact.

Cumulative Noise Levels

The Certified EIR determined that noise levels from operations for the approved project may exceed the noise standards during nighttime hours at the closest residences. Noise levels from all operational noise sources of the proposed project discussed above would combine to 56 dBA L_{max}. Assuming all these activities occurred at the same time during nighttime hours, the noise level would still be below the Town's exterior nighttime noise standard of 70 dBA L_{max}. However, although the proposed project's operational noise levels do not exceed the Town's nighttime noise standard, mitigation measures identified in the Certified EIR to reduce noise impacts would still be required as part of the EIR to reduce cumulative noise levels.

Summary

Development of the proposed project would result in less than significant impacts with respect to operational noise. Additionally impacts under the proposed project would remain similar or less than those under the approved project.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

TRAFFIC NOISE

As noted in the Certified EIR, it takes a doubling of traffic volume to cause a three-decibel increase in traffic noise. Therefore, consistent with the Certified EIR, vehicular traffic trips associated with the proposed project would not result in significant traffic noise impacts on off-site sensitive uses. The proposed project is anticipated to generate 826 daily trips. Vehicles accessing the site would either come from SR-62 or from Avalon Avenue. Based on the most recent data from the Caltrans Traffic Census Program (2022), the segment of SR-62 between Pioneer Town Road and the SR-247 north junction has an average annual daily trip rate of 24,000 vehicles per day (Kimley-Horn 2025c). Conservatively assuming all vehicles associated with the fuel station were to enter and exit the site from SR-62, the additional 826 vehicles would not be enough to double the existing traffic volume and generate a noticeable increase in traffic noise.

Additionally, Table 5.14-3 of the Yucca Valley General Plan EIR states that the traffic volume of Avalon Avenue, north of Sunnyslope Drive, has 2,707 daily trips (Kimley-Horn 2025c). Conservatively assuming all vehicles associated with the fuel station were to enter and exit the site from Avalon Avenue, the additional 826 vehicles would not be enough to double the existing traffic volume and generate a noticeable increase in traffic noise. Therefore, operational traffic associated with the proposed project would result in a less than significant impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Generation of excessive groundborne vibration or groundborne noise levels?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that residences nearest the approved project would experience vibration levels that could cause annoyance. The Certified EIR states that bulldozers and other heavy equipment would generate approximately 92 VdB of groundborne vibration at 50 feet and that at each doubling of the distance, the vibration level would be approximately 6 VdB lower based on the FTA's *Transit Noise and Vibration Impact Assessment Manual*. The Certified

EIR also states that annoyance often occurs when vibrations exceed the threshold of perception (65 VdB) by 10 decibels or more.

The Certified EIR determined that existing residence located 150 feet to the west of the approved project site would be exposed to vibration levels between 80 and 86 VdB during construction which would result in annoyance, while vibrations from operations (trucks and other on-road vehicles) would not. The Certified EIR concluded that although groundborne vibration during construction would be temporary, impacts from groundborne vibration during construction would be significant and unavoidable, as no mitigation measures would reduce this impact to less than significant.

The proposed project construction site is approximately 410 feet from the property line of the nearest sensitive receptor. Following the Certified EIR's methodology of reducing groundborne vibrations by 6 VdB each time the distance is doubled, at 400 feet the vibrations from construction would be reduced to 74 VdB, which is below the annoyance threshold of 75 VdB defined in the Certified EIR. In addition, the current version of the FTA's *Transit Noise and Vibration Impact Assessment Manual* (2018) includes lower vibration source levels for construction equipment. Based on the 2018 version of the manual, bulldozers would generate 87 VdB of groundborne vibration at 25 feet; at a distance of 410 feet, the nearest sensitive receptor would experience vibration levels of 51 VdB, which is below the annoyance threshold of 75 VdB. Therefore, construction vibrations would not cause annoyance, and impacts from groundborne vibrations would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Yucca Valley Airport is approximately one mile west of the proposed project site. It is a privately owned airstrip that has been leased on a long term to the Yucca Valley Airport District. According to the Airport Comprehensive Land Use Plan for the Yucca Valley Airport, the proposed project site is located outside of the 60 CNEL contour line for Yucca Valley Airport. Although there may be occasional aircraft flyover noise that is higher than the ambient noise level, because the proposed project is outside of the 60 CNEL contour line for the Yucca Valley

Airport, airport noise levels at the proposed project site are within normally acceptable levels, resulting in a less than significant impact.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.13.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. The Certified EIR identified Mitigation Measures 4.11.1A, 4.11.3A, and 4.11.3B. Mitigation Measures 4.11.3A, and 4.11.3B are not applicable to the proposed project. Mitigation Measures 4.11.3A, and 4.11.3B were previously incorporated into the approved project but have been removed from the proposed project's MMRP because loading dock noise is not associated with fuel stations.

Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and underline for new, inserted text

The Certified EIR Mitigation Measure 4.11.1A is reproduced below.

> **4.11.1A** Construction activities are restricted within the Town to the hours of 7:00 a.m. to 10:00 p.m. Monday through Saturday. The following measures would reduce short-term construction-related noise impacts resulting from the project:
>
> - During all project site excavation and grading onsite, the project contractor shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers consistent with manufacturer's standards.
> - The project contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site.
> - The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receptors nearest the project site during all project construction.

~~**4.11.3A** Nighttime operation of delivery trucks shall be limited to less than 30 minutes each.~~

~~**4.11.3B** Nighttime operation of delivery truck beepers shall be prohibited for on-site vehicles.~~

3.14 POPULATION AND HOUSING

3.14.1 Summary of Impacts Identified in the Approved Project

- **Unplanned Population Growth**. The Certified EIR determined the approved project would result in an increase in employment opportunities but would not induce substantial population growth and concluded that because most of the new jobs would likely be filled by existing residents, the approved project would not induce substantial population growth, and impacts would be less than significant.
- **Displace Substantial Housing/People**. The Certified EIR found that approved project would not displace substantial housing or people. Because the proposed commercial development would not remove or require the replacement of any existing housing and adequate housing capacity exists within the Town, the Certified EIR concluded that there would be no impact related to the displacement of people or housing.

3.14.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Induce substantial unplanned population growth in an area, either directly (for example, by	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?					
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	NI	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would include development of a six-pump fuel station with a canopy and convenience store. Construction of the proposed project would remain short-term in nature. Additionally, general construction labor is expected to be available from the local and regional labor pool. Similar to the approved project, construction of the proposed project would not directly or indirectly result in unplanned growth, and impacts would be less than significant.

Although the specific location and design of the current proposed fueling facility differ from the original layout, the proposed fuel station's project site boundaries are consistent with the approved project. The fuel station would largely remain consistent with the approved project as a six-pump fuel station with a canopy. The convenience store, which was not previously part of

the approved project, would result in an increase of six employment opportunities, a minor increase compared to the approved project. As with the approved project, the increase in employment opportunities would likely to be filled by persons already residing in the area and not result in substantial unplanned population growth within the Town. Additionally, the proposed project would not develop any new housing. The increase in new employees would not induce substantial unplanned population growth in the area directly or indirectly.

The proposed project includes various infrastructure improvements on the project site to serve the six-pump fuel station and convenience store, such as but not limited to USTs, utility connections to existing utilities, a new driveway and drive lanes. These components would serve the proposed project and would not represent the type of infrastructure that would result in indirect unplanned population growth. Therefore, impacts related to direct or indirect population growth would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As with the approved project, no dwelling units or residential uses currently occupy the project site. Therefore, no impact would occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.14.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to population and housing. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.15 PUBLIC SERVICES

3.15.1 Summary of Impacts Identified in the Approved Project

FIRE PROTECTION SERVICES

The Certified EIR determined that development of the approved project would increase demand for fire protection services provided by the San Bernardino County Fire Department. At the time of analysis, the Fire Department operated above recommended service capacity and relied on mutual aid agreements to maintain response levels. The Certified EIR concluded that retail, fueling, and restaurant uses would increase fire flow demand, emergency calls, and traffic congestion that could slow response times.

To address these impacts, the Certified EIR adopted Mitigation Measures 4.13.1A and 4.13.1B, requiring payment of fair-share fees to a Town-wide public services assessment district and provision of a looped water system to provide adequate fire flow. With implementation of these measures, fire protection impacts were reduced to a less-than-significant level.

POLICE PROTECTION SERVICES

The Certified EIR noted that police protection in the Town of Yucca Valley was provided by the San Bernardino County Sheriff's Department. Although most employment opportunities generated by the approved project were expected to be filled by existing residents, the proposed retail and commercial uses would increase the frequency of calls for service and demand for patrol coverage.

To ensure adequate law enforcement capacity, the Certified EIR adopted Mitigation Measure 4.13.2A, requiring payment of fair-share fees to a Town-wide public services assessment district for the expansion of police facilities and acquisition of new equipment. With implementation of this mitigation measure, impacts on police protection services were reduced to a less than significant level.

SCHOOLS

The Certified EIR determined that the approved project would not substantially increase the number of school-aged children, as the approved project consisted entirely of commercial uses and would primarily employ existing residents. The applicant was required to pay statutory school impact fees in accordance with Senate Bill 50 (Government Code Section 65995 et seq.). Compliance with these mandatory provisions ensured that potential impacts were fully mitigated and, therefore, less than significant.

PARKS AND OTHER PUBLIC FACILITIES

Because the approved project did not involve residential development or population growth, the Certified EIR determined that it would not result in a substantial increase in demand for parks, libraries, or other public facilities. Therefore, impacts on other public services were determined to be less than significant, and no mitigation measures were required.

3.15.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:					
Fire protection?	LTS/M	No	No	No	**Yes**

Other public facilities?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

FIRE PROTECTION?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that the approved project would increase demand for fire protection services and required implementation of Mitigation Measures 4.13.1A and 4.13.1B, which mandate payment of fair-share fees to a Town-wide public services assessment district and installation of a looped water system to ensure adequate fire flow.

The proposed project, which involves development of a new six-pump fuel station and 1,556-square-foot convenience store within the existing Walmart Supercenter parking lot, would not alter the existing development footprint or increase overall building intensity within the Plan area. The project site is fully served by existing water infrastructure, roadways, and emergency access routes. Because the proposed project would not result in new demand beyond that analyzed in the Certified EIR, and because the mitigation measures remain applicable, no new or expanded fire protection facilities would be required. Therefore, the proposed project would not result in substantial adverse physical impacts related to fire protection, and impacts would remain less than significant with implementation of previously adopted mitigation measures.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

POLICE PROTECTION?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR concluded that the approved project would increase demand for police protection services and adopted Mitigation Measure 4.13.2A, requiring payment of fair-share fees to a Town-wide public services assessment district to support law enforcement facility and equipment improvements.

The proposed project would not introduce new residential uses or increase population and would generate only a minor operational demand for law enforcement services typical of a small retail fueling facility. The project site is within an established commercial corridor with routine police patrol coverage. Implementation of Mitigation Measure 4.13.2A would continue to ensure adequate funding for police services.

Accordingly, the proposed project would not require new or expanded police protection facilities, and impacts would remain less than significant with implementation of previously adopted mitigation measures.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

SCHOOLS?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As found in the Certified EIR, the approved project was commercial in nature and would not generate new residential population or substantially increase enrollment in local schools. The proposed project would similarly consist of commercial uses. A fuel station and convenience store would not introduce or house new residents.

In accordance with Senate Bill 50 (Government Code Section 65995 et seq.), the project applicant would continue to be required to pay statutory school impact fees to the appropriate school district. Compliance with these mandatory provisions would fully mitigate potential school-related impacts. Therefore, the proposed project would not result in the need for new or expanded school facilities, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

PARKS?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that the approved project would not result in an increase in population and therefore would not increase demand for parks or recreational facilities. The proposed project would maintain a similar non-residential land use profile and would not increase the Town's population. Therefore, the proposed project would not contribute to the need for new or expanded park facilities, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

OTHER PUBLIC FACILITIES?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR found that the approved project would not result in substantial demand for other public facilities such as libraries or government offices, as it did not involve residential growth. The proposed project would maintain the same commercial character and would not increase population or service demands. Therefore, the proposed project would not require the construction or expansion of other public facilities, and impacts would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.15.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified

EIR have been incorporated into the proposed project's mitigation monitoring and reporting program.

The Certified EIR Mitigation Measures 4.13-1A, 4.13-1B, and 4.13.2A, are reproduced below.

> **4.13-1A** Prior to the issuance of occupancy permits, the project applicant shall make payment of fair share contribution fees (as determined by the Fire Chief) to a Town-wide public services assessment district.
>
> **4.13-1B** Prior to the issuance of grading permits, the project applicant shall submit for review and approval by the Fire Chief, a site plan design which includes looped water service which provides adequate fire flow (as determined by the Fire Chief).
>
> **4.13.2A** Prior to the issuance of occupancy permits, the project applicant shall make payment of fair share contribution fees to a City-wide public services assessment district.

3.16 RECREATION

3.16.1 Summary of Impacts Identified in the Approved Project

- **Increased Use of Parks or Recreational Facilities**. According to the Certified EIR the approved project may result in an increase in use of parks and recreational facilities. Although the approved project does not include a residential, park, or recreation component, the approved project's retail and restaurant uses would generate employment opportunities. The Certified EIR determined the approved project is unlikely to significantly increase local or regional populations, and that any resulting increase in demand for existing or planned neighborhood or regional parks and other recreational facilities would be less than significant.
- **Provide Parks or Recreational Facilities**. The Certified EIR stated that the approved project does not include a park or residential component. Therefore, impacts related to parks and recreational facilities would be less than significant.

3.16.2 Impacts Associated with the Proposed Project

Would the Project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	LTS	No	No	No	**Yes**
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation;
SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Consistent with the approved project, no parks or recreational facilities are proposed. Although the proposed project would generate an increase in six employment opportunities, the new positions are likely to be filled by persons already residing in the Town. As discussed in Impact 3.14 (a), the proposed project would not result in significant increase in population growth.

Therefore, a less than significant increase in demand on existing or planned neighborhood/ regional parks or other recreational facilities will occur.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed above, the proposed project would not construct any recreational facilities, would not significantly increase the local or regional population base, and would not result in the need for new or expanded parks. Therefore, impacts would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.16.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to recreational services and facilities. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.17 TRANSPORTATION/TRAFFIC

3.17.1 Summary of Impacts Identified in the Approved Project

- **Consistency with Circulation System Plans**. The Certified EIR evaluated traffic operations using Level of Service (LOS) under the San Bernardino County CMP Traffic Impact Analysis Guidelines for both Opening Day (2007) and Year 2030 scenarios. Under Opening Day + Project conditions, five intersections would operate below the Town's LOS standard, constituting a significant impact. Implementation of Mitigation Measures 4.15-1A (signal

and striping improvements) and 4.15-1B (payment of Town traffic and signal impact fees) reduced intersection impacts to acceptable LOS. However, under Year 2030 + Project cumulative conditions, several intersections would still exceed LOS standards due to regional growth, and impacts were determined to remain significant and unavoidable even with implementation of Mitigation Measure 4.15-2A (fair-share payment of traffic and signal impact fees).

- **Vehicle Miles Traveled**. The Certified EIR was prepared prior to adoption of VMT as a CEQA metric and therefore relied on LOS and CMP methodologies. At the time of certification, VMT analysis was not required, and no significance determination under Section 15064.3 applied.

- **Transportation Safety and Design Hazards**. The Certified EIR identified a potential sight-distance hazard at the proposed signalized driveway on SR-62. Mitigation Measure 4.15-3A requires grading and landscaping plans to preserve a minimum 942-foot westerly sight distance, ensuring adequate visibility consistent with Caltrans standards. With implementation of this measure, impacts were determined to be less than significant.

- **Emergency Access**. The Certified EIR concluded that the approved project would maintain adequate emergency access to and within the site. Circulation and driveway configurations would not interfere with emergency-response operations or evacuation routes. Therefore, impacts were less than significant.

3.17.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	LTS/M	No	No	No	**Yes**
d) Result in inadequate emergency access?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

A Transportation Impact Analysis (TIA) was prepared for the proposed project by Kimley-Horn and Associates Inc. (dated September 2025) to evaluate potential traffic, circulation, and access impacts associated with development of six new fueling dispensers and a 1,556-square-foot convenience store within the existing Walmart Supercenter parking lot. The analysis evaluated trip generation, distribution, intersection operations, queuing, site circulation, and VMT in accordance with the Town of Yucca Valley, Caltrans, and San Bernardino County Transportation Impact Study Guidelines (SBC 2019) (see Appendix F).

a) Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR evaluated buildout of approximately 28 acres of commercial development, including a 229,000-square-foot Walmart Supercenter, a six-pump fuel station, and a fast-food restaurant, and required implementation of Mitigation Measures 4.15.1A, 4.15.1B, and 4.15.2A for intersection and roadway improvements. These measures (signalization/striping at specified intersections and payment of Town traffic/signal impact fees) are related to traffic congestion and are no longer considered environmental impacts by the Town, pursuant to Senate Bill 743.

The proposed project (six fueling dispensers and a 1,556-square-foot convenience store) would generate approximately 826 daily trips, including 46 AM and 72 PM peak-hour trips. Accounting for pass-by trips (60 percent daily, 63 percent AM, 57 percent PM), the proposed project would result in negligible net increases in local traffic.

The proposed project would utilize existing driveways, drive aisles, and signalized access points, and no changes to the surrounding roadway network or bicycle/pedestrian facilities are proposed. During construction, short-duration work adjacent to the existing Morongo Basin Transit Authority (MBTA) bus stop may be required; the applicant would coordinate in advance with MBTA to maintain access or provide a brief, agency-approved temporary relocation. Such temporary conditions would not alter transit service levels, routes, or adopted transit plans. Therefore, the proposed project would not conflict with any adopted circulation plans or policies.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Conflict or be inconsistent with CEQA Guidelines § 15064.3, subdivision (b)?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project qualifies for VMT screening under the San Bernardino County Transportation Impact Study Guidelines because it is a local-serving use under 50,000 square feet that primarily serves the surrounding community (SBC 2019). The TIA concluded that the project screens out of VMT analysis and would be presumed to have a less-than-significant impact consistent with the intent of SB 743. Therefore, no further VMT assessment is required.

The Certified EIR predated the adoption of CEQA Guidelines Section 15064.3(b), which establishes VMT as the primary metric for evaluating transportation impacts. However, the proposed project would not increase the total building area or introduce new destination-oriented uses that would generate additional regional travel demand.

Trips generated by the convenience store would largely be captured as pass-by trips associated with existing commercial traffic on SR-62 and Avalon Avenue. Because the proposed project would not result in a measurable increase in regional VMT relative to the approved project, it would not conflict with CEQA Guidelines Section 15064.3(b). Therefore, VMT-related impacts would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed fuel station would be constructed within the existing Walmart parking lot and would not modify existing roadway geometry or intersection design. Access would occur through two existing driveways along SR-62: a right-in/right-out driveway and a full-access driveway. The TIA's on-site queuing analysis found that the 95th percentile queues at both driveways would not back into internal aisles or SR-62, demonstrating adequate storage and safe operations**.**

No new conflicts with transit, bicycles, or pedestrians are anticipated, as existing sidewalk and transit facilities would remain intact. A new pedestrian walkway provided by the proposed project would connect the proposed project to the existing bus stop, thereby improving project site accessibility. Accordingly, the proposed project would not introduce hazardous geometric features or incompatible uses, and impacts would be less than significant with continued compliance with Certified EIR Mitigation Measure 4.15.3A (sight-distance preservation at SR-62 driveway).

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Result in inadequate emergency access?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would retain the existing circulation pattern and emergency access routes serving the Walmart Supercenter site. The Town's emergency services would continue to use SR-62 and Avalon Avenue for access, and on-site drive aisles would accommodate fire and

emergency vehicles consistent with Town of Yucca Valley Fire Department standards. The TIA found no conditions that would impede emergency access or circulation. Therefore, this impact would remain less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.17.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and <u>underline</u> for new, inserted text.

The Certified EIR Mitigation Measures 4.12-1 through 4.12-3 are reproduced below. Mitigation measures related to level-of-service (LOS) are not applicable.

> ~~**4.15-1A** All Prior to issuance of certificates of occupancy, the project applicant shall construct the following improvements:~~
>
> - ~~Inca Trail/Twentynine Palms Highway (SR-62). Install traffic signal.~~
> - ~~Old Woman Springs Road (SR-247)/Buena Vista Drive. Install traffic signal.~~
> - ~~Joshua Lane/Yucca Trail. Install traffic signal.~~
> - ~~Joshua Lane/Onaga Trail. The re-striping of a southbound shared lane to a southbound shared left-turn/through lane, and the addition of a southbound shared through/right-turn lane.~~
> - ~~Palomar Avenue/Yucca Trail. Install traffic signal~~
>
> ~~**4.15-1B** Pay all applicable Town traffic and signal impact fees.~~
>
> ~~**4.15-2A** Prior to issuance of certificates of occupancy, the project applicant shall pay all applicable CMP fair-share fees as determined by the TIA ($676,097).~~
>
> **4.15-3A** Prior to issuance of grading permits, the project applicant shall submit and receive Town approval of detailed grading and landscaping plans to ensure that grading elevation, height of landscaping, vegetation, fencing, monumentation, signage, and

other visual obstructions along the project site frontage do not obstruct the minimum sight distance requirement of 942 feet westerly from the proposed signalized driveway on SR-62. This area falls primarily within the proposed detention basin between the proposed signalized driveway and the proposed right in/out only driveway on SR-62.

3.18 TRIBAL CULTURAL RESOURCES

3.18.1 Summary of Impacts Identified in the Approved Project

At the time of preparation of the Certified EIR, tribal cultural resources was not one of the environmental topics within the CEQA Guidelines Appendix G Environmental Checklist.

3.18.2 Impacts Associated with the Proposed Project

Would the Project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place,	N/A	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
or object with cultural value to a California Native American tribe, and that is:					
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	N/A	No	No	No	**Yes**
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall	N/A	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
consider the significance of the resource to a California Native American tribe.					

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. As discussed under Impact 3.5(a), the project site is not listed in the California Register of Historical Resources, National Register of Historic Places, California State Historical Landmarks, or Points of Historical Interest or in a local register of historical resources. As identified in the approved project, regular maintenance, resurfacing, and widening to a four-lane thoroughfare have obliterated any remaining trace of the historic portions of Highway 62 within or adjacent to the project site (OHP 2025; NPS 2025; Yucca Valley 2022). The proposed project would be within the boundaries of the approved Specific Plan area and would not impact any known historical sources. Additionally, the Open Space and Conservation Element of the Town's General Plan states, "no Native American cultural resources that may have traditional or cultural significance have been

identified by records searches, literature reviews, and consultation with interested parties" within the Town (Yucca Valley 2022).

Further, as part of the SB 18 process, the NAHC sacred lands file (SLF) search was conducted and yielded a negative result, which indicates that no known sacred sites or tribal cultural resources existing within the project site or the vicinity. The NAHC provided a list of 14 California Native American tribes that are traditionally and culturally affiliated with the project site area and may have additional information. Pursuant to SB 18, the Town invited 14 tribes to consult based on NAHC's Native American Contact List—Agua Caliente Band of Cahuilla Indians, Augustine Band of Cahuilla Indians, Cabazon Band of Cahuilla Indians, Cahuilla Band of Indians, Los Coyotes Band of Cahuilla and Cupeño Indians, Quechan Indian Tribe of the Fort Yuma Reservation, Ramona Band of Cahuilla, San Manuel Band of Mission Indians, Santa Rosa Band of Cahuilla Indians, Serrano Nation of Mission Indians, Soboba Band of Luiseno Indians, Twenty-Nine Palms Band of Mission Indians, Morongo Band of Mission Indians, and Torres-Martinez Desert Cahuilla Indians. The invitation letters were sent to tribes on July 21, 2025, and July 25, 2025, via email and/or mail to the available addresses.

Four tribes responded to the request, and three requested formal consultation. The Twenty-nine Palms Band of Mission Indians responded on March 10, 2025, requesting formal consultation under SB 18. The Town met with the Tribe on July 10, 2025. The Morongo Band of Mission Indians responded on March 27, 2025, requesting formal consultation under SB 18. The Town provided a draft version of this Addendum to the Tribe and received no response or comments. The Yuhaaviatam of San Manuel Nation responded on August 5, 2025, confirming formal consultation is not required, and shared recommended mitigation measures. The Agua Caliente Band of Cahuilla Indians responded on August 5, 2025, requesting formal consultation under SB 18. The Town met with the Tribe on August 6, 2025, and the Tribe followed up after the meeting via email with a letter requesting the presence of an approved Cultural Resource Monitor(s) from a Consulting Tribe during any ground-disturbing activities.

The Morongo Band of Mission Indians, Yuhaaviatam of San Manuel Nation, Agua Caliente Band of Cahuilla Indians, and Twenty-Nine Palms Band of Mission Indians also requested the presence of a tribal cultural monitor during ground disturbing activities, due to the potential of unearthing unknown resources. Mitigation Measure 4.5.2B would be implemented to ensure that impacts related to tribal cultural resources are less than significant. With the incorporation of Mitigation Measure 4.5.2B, impacts to tribal cultural resources would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR

under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is developed with the existing Walmart Supercenter parking lot and is surrounded by a mix of commercial and retail uses along SR-62. The NAHC's Sacred Lands File record search received a negative result on July 17, 2025; thus, no tribal resources are known to exist within the project site.

As described under the prior threshold, consultation was conducted pursuant to SB 18 and several tribes requested the presence of a tribal cultural monitor during ground-disturbing activities. Mitigation Measure 4.5.2B would be implemented to ensure that impacts related to tribal cultural resources are less than significant.

Additionally, as discussed in Section 3.5, *Cultural Resources*, in the unlikely event human remains are encountered during ground-disturbing activities the human remains would be treated in accordance with procedures and requirements in Sections 5097.94 and 5097.98 of the Public Resources Code; Section 7050.5 of the California Health and Safety Code; and CEQA Guidelines Section 15064.5. However, as discussed in Impact 3.18(a)(i) above, multiple tribes requested to be contacted in the event tribal cultural resources are uncovered due to the potential of unearthing unknown tribal cultural resources. With the incorporation of Mitigation Measure 4.5.2B, impacts to tribal cultural resources would be less than significant.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.18.3 Adopted Mitigation Measures Applicable to the Proposed Project

The following applicable mitigation measures were taken directly from the Certified EIR and would be incorporated as part of the proposed project. Applicable mitigation measures from

the Certified EIR have been incorporated into the proposed project's mitigation monitoring and reporting program. Any modifications to these mitigation measures are shown in ~~strikethrough~~ for deleted text and underline for new, inserted text.

The Certified EIR Mitigation Measure 4.5.2B (as modified) would apply to the proposed project and is provided in Section 3.5, *Cultural Resources*.

3.19 Utilities and Service Systems

3.19.1 Summary of Impacts Identified in the Approved Project

- **Relocation or Construction of New or Expanded Utility Facilities.** The Certified EIR determined that development under the approved project would increase demand for water supply, wastewater treatment, storm drainage, and other utilities, including electricity, natural gas, and telecommunications. However, the Certified EIR found that all necessary utility connections could be accommodated within existing or planned infrastructure systems.. Impacts were determined to be less than significant.

- **Sufficiency of Water Supplies**. The Certified EIR found that the Hi-Desert Water District (HDWD) had adequate water supplies to serve the approved project and other planned development under normal, dry, and multiple-dry-year conditions. Impacts related to water-supply sufficiency were less than significant.

- **Adequate Wastewater Treatment Capacity**. At the time of the Certified EIR, the Town of Yucca Valley did not operate a centralized wastewater collection or treatment system. The approved project was to utilize on-site septic systems, consistent with County standards for siting, percolation, and maintenance. Although the Certified EIR acknowledged that reliance on septic systems could constrain long-term regional growth, it concluded that the approved project would not individually necessitate expansion of treatment facilities or exceed the capacity of existing on-site systems. Therefore, wastewater impacts were found to be less than significant.

- **Solid Waste Generation and Landfill Capacity**. The Certified EIR found that construction and operation of the approved project would generate additional solid waste, but that disposal would continue to occur at regional landfill facilities with sufficient permitted capacity to accommodate the project's waste stream. With compliance to State requirements, the Certified EIR concluded that solid-waste generation would not exceed local or State capacity standards and that impacts would be less than significant.

- **Compliance with Solid Waste Regulations**. The Certified EIR determined that the approved project would be required to comply with all applicable federal, State, and local solid-waste

management regulations, including diversion and recycling mandates implemented through the Town's solid-waste collection contracts. The Certified EIR concluded that the approved project would comply with all applicable solid-waste statutes and regulations, and impacts would be less than significant.

3.19.2 Impacts Associated with the Proposed Project

Would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	LTS	No	No	No	**Yes**
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	LTS	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	LTS	No	No	No	**Yes**
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	LTS	No	No	No	**Yes**
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	LTS	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The proposed project would not result in changes to land use or zoning and would involve the conversion of a surface parking area to a fuel station with a convenience store, consistent with the approved project analyzed in the Certified EIR. The proposed project would continue to be served by existing and planned HDWD water facilities, on-site storm drainage infrastructure, and other utilities (electric, gas, and telecommunications).

The Certified EIR concluded that utility infrastructure demands generated by the approved project could be accommodated by existing or planned systems and would not require new off-site improvements that could result in significant environmental effects. The proposed project would not increase utility demands beyond what was previously analyzed. The relocated fuel station and new convenience store represent a minor modification to on-site utility connections but would not require expanded water supply, drainage, or energy infrastructure.

Accordingly, the proposed project would not result in the relocation or construction of new or expanded utility facilities that could cause significant environmental effects. Impacts would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR determined that HDWD had adequate water supplies to serve the approved project, based on available groundwater resources and planned infrastructure improvements. Since certification of the EIR, HDWD has continued to maintain reliable groundwater supplies through local wells and conservation programs.

The proposed project would not substantially change water demand compared to the approved project. The relocated fuel station and small convenience store would require standard potable water connections, similar to the approved commercial development. No new water-intensive uses are proposed, and the project would remain subject to HDWD's connection, conservation, and water-efficiency requirements. Therefore, sufficient water supplies would be available to

serve the project during normal, dry, and multiple-dry-year conditions, and impacts would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. At the time of the Certified EIR, the Town of Yucca Valley relied on on-site septic systems. The approved project proposed to use on-site wastewater disposal consistent with County Environmental Health standards, and impacts were found to be less than significant.

Since that time, the HDWD Wastewater Reclamation Project has been completed, providing a centralized wastewater collection and treatment system for the Town of Yucca Valley. The proposed project would connect to this existing public sewer system rather than use septic disposal. As a result, wastewater management under the proposed project would be improved relative to the approved project, reducing the potential for localized groundwater or soil impacts.

The HDWD Wastewater Reclamation Facility currently operates with available capacity and has sufficient treatment capability to accommodate the project's minor wastewater generation. Therefore, the proposed project would not exceed treatment capacity or require expansion of facilities, and impacts would remain less than significant, consistent with and incrementally improved relative to the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR concluded that the approved project would generate solid waste that could be

accommodated by existing regional landfill capacity and that compliance with Assembly Bill 939 diversion requirements would ensure impacts remained less than significant.

The proposed project would generate similar quantities of solid waste as the approved project, primarily from commercial operations and customer waste associated with the fuel station and new convenience store. Disposal services would continue to be provided by the Town's contracted waste hauler, with waste directed to County-approved facilities with adequate capacity.

Since certification of the EIR, additional solid-waste reduction measures have been implemented under Senate Bill 1383, which establishes organic-waste recycling requirements. The proposed project would be required to comply with these regulations, further ensuring that landfill impacts remain less than significant. Therefore, impacts would remain less than significant, consistent with and marginally improved compared to the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The Certified EIR found that the approved project would comply with applicable State and local solid-waste management regulations, including diversion and recycling requirements under AB 939. The proposed project would be subject to the same, and now more stringent, solid-waste diversion requirements under SB 1383 and the Town's updated municipal code. The project would provide standard waste collection and recycling facilities consistent with Town requirements for commercial uses.

Compliance with these regulations would ensure that solid waste is properly managed and diverted from landfill disposal. Therefore, impacts related to compliance with solid-waste statutes and regulations would remain less than significant, consistent with the Certified EIR.

Consequently, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.19.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were identified in the Certified EIR for Utilities and Service Systems. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

3.20 Wildfire

3.20.1 Summary of Impacts Identified in the Approved Project

At the time of preparation of the Certified EIR wildfire was not one of the environmental topics within the CEQA Guidelines Appendix G Environmental Checklist. However, wildfire and emergency response plans were discussed in the Hazards and Hazardous Materials section and are summarized in Section 3.9, *Hazards and Hazardous Materials*, of this Addendum.

3.20.2 Impacts Associated with the Proposed Project

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	N/A	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	N/A	No	No	No	**Yes**
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	N/A	No	No	No	**Yes**

Environmental Issues	Level of Impact in Certified EIR	Conditions Requiring Subsequent Review			Proposed Project Meets the Conditions for an Addendum *CEQA Guidelines Section 15164*
		Change in Project or Circumstances Involving New or More Severe Significant Effects *CEQA Guidelines Section 15162(a)(1–2)*	**New Information Showing New or More Severe Significant Effects** *CEQA Guidelines Section 15162(a)(3)(A–B)*	**New Mitigation or Alternative to Reduce Significant Effect Is Declined** *CEQA Guidelines Section 15162(a)(3)(C–D)*	
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	N/A	No	No	No	**Yes**

Key: NI = no impact; LTS = less than significant; LTS/M = less than significant with mitigation; SU = significant and unavoidable; N/A = topic not analyzed in Certified EIR

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is located within a Local Responsibility Area (LRA) and is within an area designated as a moderate Fire Hazard Severity Zone (FHSZ) (CAL FIRE 2024). The nearest very high FHSZ, according to CAL FIRE, is within a State Responsibility Area (SRA) approximately 10.3 miles northwest of the project site (CAL FIRE 2024). Additionally, based on U.S. Forest Service Wildland-Urban Interface (WUI) mapping, the project site is not within the WUI; however, the project site is bounded by the WUI to the north across SR-62 (USFS 2020).

The Town of Yucca Valley maintains the 2025 Hazard Mitigation Plan (HMP), which is a plan to identify and profile hazard conditions, analyze risk to people and facilities, and develop mitigation actions to reduce or eliminate hazard risks in Yucca Valley. Although there is no local emergency evacuation plan available, the Western Riverside Council of Governments (WRCOG) in collaboration with the San Bernardino County Transportation Authority (SBCTA) identified evacuation routes in the region, which include SR-62 and Avalon Avenue. The proposed project's construction and equipment would be staged within the project site. As discussed in

Section 3.17, *Transportation*, the proposed project would not physically impede the circulation network and the surrounding roadways. Additionally, the proposed project would connect its driveway to the existing circulation infrastructure and would include a direct egress onto CA-62 that would not block the evacuation route. As with the approved project, project design and construction would be required to comply with applicable emergency access standards, and construction activities that might temporarily restrict access would be managed with traffic control measures to maintain emergency response capability. Therefore, the proposed project would result in a less than significant impact.

Although wildfire and associated impacts were not previously analyzed as part of the approved project, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. Since certification of the EIR, the approved project site has been fully developed with the Walmart Supercenter and parking lot, which is generally flat with a slight slope along landscaped areas. The Town of Yucca Valley is intermittently impacted by Santa Ana winds, the hot, dry winds that blow across southern California in the spring and late fall (April through November) (Yucca Valley 2022). Santa Ana wind events can increase wildfire risk.

The proposed project would not construct a structure that would affect prevailing winds. The proposed project would be designed in accordance with the CBC and California Fire Code. Fire suppression equipment specific to construction would be maintained on site. Construction of the proposed project would comply with applicable codes and ordinances related to the maintenance of mechanical equipment, handling and storage of flammable materials, and cleanup of spills of flammable materials. Therefore, the proposed project would not expose project occupants to pollutant concentrations from wildfire or the uncontrolled spread of wildfire due to slope, prevailing winds, and other factors. Impacts would be less than significant.

Although wildfire and associated impacts were not previously analyzed as part of the approved project, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is in an LRA and is designated a moderate FHSZ (CAL FIRE 2024). The nearest very high FHSZ, according to CAL FIRE, is in an SRA approximately 10.3 miles northwest of the project site. Based on the U.S. Forest Service Wildland Urban Interface (WUI) mapping, the project site is not in the WUI; however, it is bounded by the WUI to the north across SR-62 (USFS 2020). The project site is in a developed area and would be served by existing utility infrastructure. The proposed project would be served by existing utility infrastructure and would connect to these utilities via underground connections.

The proposed project would be designed and constructed in accordance with the CBC and the California Fire Code, as adopted and enforced by the Town of Yucca Valley. The new driveway and utility connections would not exacerbate fire risk. Development of the proposed project would not require the installation of roads and fuel breaks. Therefore, the proposed project does not include the installation or maintenance of infrastructure that could exacerbate fire risk or result in temporary or ongoing impacts to the environment. Impacts would be less than significant.

Although wildfire and associated impacts were not previously analyzed as part of the approved project, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Project Meets the Conditions for an Addendum Pursuant to CEQA Guidelines Section 15164. The project site is within an LRA and is designated a moderate FHSZ (CAL FIRE 2024). As discussed in Section 3.7, *Geology and Soils*, and Section 3.10, *Hydrology and Water Quality*, the proposed project would result in a less than significant impact related to flooding, landslides, stormwater/drainage, and slope instability with adherence with CBC and the geotechnical engineering report recommendations. Therefore, the proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. A less than significant impact would occur.

Although wildfire and associated impacts were not previously analyzed as part of the approved project, the proposed project would not result in new significant environmental effects or substantially increase the severity of previously identified significant effects and, therefore, would not trigger the need for preparation of a subsequent or supplemental EIR under the criteria in Public Resources Code Section 21166 and CEQA Guidelines Sections 15162(a) and 15163(a).

3.20.3 Adopted Mitigation Measures Applicable to the Proposed Project

No mitigation measures were adopted as part of the approved project's Certified EIR relating to wildfire. As discussed above, the proposed project is within the scope of the approved project, and no mitigation measures are warranted.

This page is intentionally left blank

4. FINDINGS

As summarized below, and for the reasons described in Section 3, *Environmental Analysis*, of this Addendum, the Town of Yucca Valley has concluded that the proposed project meets the conditions of CEQA Guidelines Section 15164 and that therefore an Addendum to the Certified EIR is the appropriate CEQA document to address the proposed project.

As previously discussed, under CEQA Guidelines Section 15164, an addendum to an EIR or MND may be prepared if only minor technical changes or additions are necessary or none of the conditions described in CEQA Guidelines Section 15162 calling for the preparation of a subsequent EIR or MND have occurred. The following restates the standards in CEQA Guidelines Section 15162 as they relate to the proposed project.

1. **No substantial changes are proposed in the project which would require major revisions of the previous EIR due to the involvement of new significant environmental effect or a substantial increase in the severity of previously identified significant effect.**

As discussed in Section 2.3 of this Addendum, the proposed project would construct a development of a new fuel station and convenience store within the northeastern portion of the existing Walmart Supercenter parking area. While the Certified EIR analyzed a fuel station as part of the overall development program, the specific location and design of the current proposed fueling facility differ from the original layout. However, the use, intensity, and environmental footprint are similar to the fuel station analyzed in the Certified EIR. Additionally, the proposed project includes the construction of a convenience store associated with the fuel station, which was not previously analyzed as part of the approved project.

The proposed project would remain within the previously approved Specific Plan area boundaries and would not introduce new land uses or expand the development footprint. Accordingly, no new or more severe impacts related to agriculture and forestry resources, cultural resources, hydrology and water quality, mineral resources, recreation, or tribal cultural resources would occur beyond those previously evaluated in the Certified EIR.

The inclusion of the convenience store was evaluated in this Addendum to determine the whether this use would result in potential impacts to aesthetics, hazardous materials, population and housing, public services, transportation, and utilities and service systems. The intensity and environmental footprint of the fuel station are similar to the approved project, and the proposed convenience store would be of a similar height. Due to existing development and vegetation surrounding the project site and distance from scenic resources, impacts to

aesthetics would be reduced to less than significant with adherence to local policies. Although the proposed convenience store would result in an increase in employment opportunities (six employment positions); the use of hazardous materials for operational purposes; minor increases in demand for public services, utilities, and service systems; and a negligible net increase in local traffic, adherence to applicable local, State, and federal policies and regulations would ensure that impacts related to hazardous materials, population and housing, public services, transportation, and utilities and service systems would remain less than significant.

At the time the Certified EIR was prepared, energy, greenhouse gas emissions, tribal cultural resources and wildfire were not included as separate environmental topics in the CEQA Guidelines Appendix G Environmental Checklist and, therefore, were not previously evaluated. Impacts associated with energy, GHG emissions, tribal cultural resources and wildfire under the proposed project have been evaluated in this Addendum and are determined to be less than significant. As discussed in Section 3.7, *Geology and Soils,* of this Addendum, although the proposed project is within the same boundaries as the approved project, the geotechnical report prepared for the proposed project included project-specific recommendations. These site-specific recommendations required minor modifications to Mitigation Measure 4.6.1A. With modification of Mitigation Measure 4.6.1A, impacts related to checklist items 3.7(c) and 3.7(d) would not result in a significant impact, consistent with the conclusions of the Certified EIR. Therefore, no substantial changes are proposed that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

2. No substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

As discussed in Section 2.3 of this Addendum, the proposed project would construct a new fuel station and convenience store within the northeastern portion of the existing Walmart Supercenter parking lot. While the Certified EIR analyzed a fuel station as part of the overall development program, the specific location and design of the currently proposed fueling facility differ from the original layout.

Since certification of the EIR, the State has updated the California Building Energy Efficiency Standards. The 2022 Standards became effective in January 2023, and the State continues to update these standards on a three-year cycle. These updates are intended to improve building energy efficiency in new construction and do not represent a substantial or unusual change in circumstances (California Department of General Services 2024). No substantial changes have occurred within the project site or surrounding area that would alter the circumstances under which the approved project would be undertaken.

As described previously, the proposed project's revised fuel station location, inclusion of a convenience store, and associated employment opportunities would result in impacts that are less than or equal to those analyzed in the Certified EIR. Impacts to the environmental thresholds would remain similar to, or less than, those identified in the Certified EIR for the approved project. Additionally, impacts related to energy, greenhouse gas emissions, tribal cultural resources and wildfire, all of which were topics not previously analyzed, were found to be less than significant. Therefore, no major revisions to the Certified EIR are required, as the proposed project would not result in new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

3. No new information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:

A. The project will have one or more significant effects not discussed in the previous EIR or negative declaration

Similar to the approved project, the proposed project would construct a new fuel station. The proposed project's specific location and design of the proposed fueling facility differ from the original layout and includes a convenience store within the northeastern portion of the existing Walmart Supercenter parking. However, the change in location, layout and the inclusion of a convenience store would not result in new or increased significant environmental impacts. Environmental impacts under the proposed project would be considered less than or equal to those analyzed in the Certified EIR. Additionally, impacts to energy, greenhouse gas emissions tribal cultural resources and wildfire, which were not previously analyzed, were found to be less than significant. There is no new information of substantial importance that shows that the proposed project would have one or more significant effects not discussed in the previous EIR.

B. Significant effects previously examined will be substantially more severe than shown in the previous EIR;

The proposed project's specific location and design of the proposed fueling facility differ from the original layout and inclusion of a convenience store would result in similar or reduced physical environmental effects, as compared to the approved project. The proposed project would implement the applicable mitigation measures originally identified in the Certified EIR and referred to throughout this analysis under the heading *Adopted Mitigation Measures Applicable to the Proposed Project*. As substantiated in this analysis, no significant effects previously examined will be substantially more severe than shown in the previous EIR.

C. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

The Certified EIR analyzed the following alternatives to the approved project:

1. **No Project**: Alternative 1, the No Project Alternative, would assume that the proposed project would not be approved and the fuel station component of the Specific Plan would not be established.

2. **Mixed Commercial/Office Alternative:** Alternative 2: the mixed commercial/office alternative would allow for the construction of 115,000 square feet of general office building, and approximately 115,000 square feet of retail uses.

3. **Off-Site Location Alternative**: Under the Off-Site Location Alternative, the project would result in the same level of development relocated to a suitable site at the northwest corner of Balsa Avenue and Yucca Trail

4. **Reduced Intensity Commercial**: Under this alternative, the project site would be developed with approximately half of the 233,000 square feet of uses envisioned under the proposed project. The 115,000 square feet of commercial uses under the Reduced Intensity Commercial Alternative would consist of a multi-tenant shopping center hosting a single mid-size anchor (50,000– 60,000 square feet).

D. No alternatives previously found to be infeasible would, in fact, be feasible under the proposed project. Mitigation Measures 4.1.1A, 4.3.2A, 4.6.2A, and 4.6.3A from the Certified EIR are not applicable to the proposed project and were therefore not incorporated. Furthermore, the modification to Mitigation Measure 4.6.1A, which requires adherence to the proposed project's geotechnical report, encompasses the intent of Certified EIR Mitigation Measures 4.6.1A, 4.6.2A, and 4.6.3A. As substantiated in Section 4 of this Addendum, the proposed project would result in impacts that are similar to or reduced compared to those identified for the approved project.

E. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

The proposed project would result in environmental impacts that are similar to or less than those of the approved project. As stated previously, no new or more severe impacts would occur as a result of the proposed project. There is no new information

of substantial importance indicating that alternatives considerably different from those analyzed in the Certified EIR would substantially reduce one or more significant environmental effects. As discussed above, Mitigation Measures 4.1.1A, 4.3.2A, 4.6.2A, and 4.6.3A from the Certified EIR are not applicable to the proposed project and were therefore not incorporated. Furthermore, the modification to Mitigation Measure 4.6.1A, which requires adherence to the proposed project's geotechnical report, encompasses the intent of Certified EIR Mitigation Measures 4.6.1A, 4.6.2A, and 4.6.3A.

APPENDIX A, AIR QUALITY AND GREENHOUSE GAS EIR ADDENDUM ANALYSIS MEMORANDUM

This page intentionally left blank.

MEMORANDUM

To:	Town of Yucca Valley Planning Division
From:	Alex Pohlman, Kimley-Horn and Associates, Inc.
Date:	August 27, 2025
Subject:	Yucca Valley Walmart Fuel Station – Air Quality and Greenhouse Gas EIR Addendum Analysis

PURPOSE

This comparative air quality impacts analysis has been undertaken to analyze whether the proposed Yucca Valley Walmart Fuel Station Project (Project) would result in any new or substantially more severe significant environmental impacts as compared to the conclusions discussed in the certified Yucca Valley Retail Specific Plan (Original Project) Environmental Impact Report (Final EIR) that was certified on June 25, 2008. The purpose of this technical memorandum is to document whether any new air quality or greenhouse gas (GHG) impacts would occur based on the proposed updates to the Project (described below) pursuant to Public Resources Code, Section 21166 or State CEQA Guidelines Section 15162.

ORIGINAL PROJECT

The Final EIR for the Original Project analyzed the development of a commercial retail center on approximately 25.51 acres located on the southeast corner of Twentynine Palms Highway (SR-62) and Avalon Avenue. The EIR analysis for the Original Project included a 229,000-square foot Walmart Supercenter, a fuel station, a 4,000-square foot fast-food restaurant with drive-through, and a detention basin. However, the Specific Plan, approved on August 14, 2008, did not include the fuel station as a permitted use and the area designated in the EIR for the fuel station and a 4,000-square foot fast-food restaurant with drive-through was ultimately developed with two smaller fast-food restaurants instead.

PROPOSED PROJECT

The proposed Project involves the development of a fuel station similar to the one previously analyzed in the Final EIR, although in a different location. The fuel station would be located in the northeastern portion of the existing parking lot, south of the detention basin and SR-62, see **Exhibit 1: Local Vicinity Map** and **Exhibit 2: Conceptual Site Plan**.

AIR QUALITY ANALYSIS

Previous Significance Determination: The Final EIR determined that the Original Project, which included a fuel station, was consistent with applicable air quality plans and policies. However, the Final EIR also determined that the Original Project would generate short-term construction emissions and long-term operational emissions that would exceed the Mojave Desert Air Quality Management District's (MDAQMD's) significance thresholds for criteria pollutants. The Final EIR identified mitigation measure 4.3.1A, which includes requirements for reducing equipment emissions and requirements during construction activities to prevent impacting traffic during peak hours; however, impacts remained significant and unavoidable.

Proposed Project Analysis:

Threshold (a) Conflict with or obstruct implementation of the applicable air quality plan.

As discussed in the Final EIR, the Original Project is consistent with the MDAQMD Air Quality Management Plan (AQMP), and as a result, the impacts of the Original Project are less than significant.

The proposed Project would be consistent with development in the area and applicable AQMP assumptions. The proposed Project would result in a similar number of permanent jobs as compared to the Original Project. Therefore, no new impacts from air quality emissions or a substantial increase in the severity of a previously identified impacts evaluated in the Final EIR would be caused by the proposed Project.

Mitigation Program

None identified in the Original Project Final EIR.

Conclusion

Project development would not result in any new impacts, or increase the severity of the previously identified impacts, with respect to compliance with applicable air quality plans. Additionally, no new information of substantial importance that was not known and could not have been known at the time the Certified EIR was certified is available that would change the significance determination for the Original Project in the Final EIR. This impact remains less than significant.

Threshold (b) Violate an air quality standard or contribute to an existing or projected air quality violation.

The proposed Project is under the jurisdiction of the MDAQMD and is located within the Mojave Desert Air Basin (MDAB). The MDAB includes the desert portions of Los Angeles, Riverside, San Bernardino, and Kern counties. The MDAB is in a federal and state non-attainment area for ozone and PM_{10}; and a state nonattainment area for particulate matter 2.5 microns in diameter or less

($PM_{2.5}$). An area is considered to be in non-attainment status when air pollution persistently exceeds the State or National Ambient Air Quality Standards.

Construction Emissions

The Project includes the demolition of an area of the existing parking lot, site preparation, grading, building construction, paving, and architectural coating. Predicted maximum daily construction-generated emissions during each year construction activities occurred are summarized in **Table 1: Construction-Related Emissions** and compared with the construction emissions identified in the Final EIR. It should be noted that the Final EIR based its construction emission analysis on the grading phase of the Original Project and used the Urban Emission (URBEMIS) model 2002 to calculate emissions. The URBEMIS software is now outdated and was replaced with California Emission Estimator Model (CalEEMod) in February 2011. This analysis has been prepared using CalEEMod version 2022.1.1.29, the most recent version available.

Table 1: Construction-Related Emissions

Source	Emissions (Pounds per Day)					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Original Project[1]						
Total Construction Emissions: No Mitigation	18	275	120	25	794	NA
Total Construction Emissions: With Mitigation	18	275	120	25	401	NA

ROG= reactive organic gases; NO_X = nitrogen oxides; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter 10 microns in diameter or less; $PM_{2.5}$ = particulate matter 2.5 microns in diameter or less; NA = data not available

1. Original Project emissions are from Final EIR, Table 4.3.M, page 4.3-38.
2. MDAQMD CEQA Guidelines, Page 9, February 2020.
3. Emissions modeled with CalEEMod version 2022. Refer to Appendix A for model outputs.

The construction emissions for the Proposed Project in **Table 1** have been conservatively modeled without mitigation and with construction beginning in 2025 and concluding in 2026.[1] As

[1] A conservative worst-case construction timeline has been modeled for analysis purposes. This involves modeling emissions at the earliest feasible date. Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover). Project construction that occurs at a later date than what was modeled impacts would result in lower emissions than those analyzed due to the use of more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase-in less polluting heavy-duty equipment. As a result, Project-related construction emissions would be lower than the impacts disclosed herein. For emissions modeling purposes, conservatively analyzing the emissions using an earlier construction start date provides for a worst-case analysis and full disclosure of potential air quality impacts, as required by CEQA.

shown in **Table 1**, the maximum daily emissions would remain below the construction emissions calculated for the Original Project and below MDAQMD's thresholds for all criteria pollutants. As a result, impacts associated with the construction of the proposed Project would be less than significant and would not require any additional mitigation.

Operational Emissions

The main source of air pollutant emissions during operations is from motor vehicles. As noted above, the Final EIR determined that original Project would exceed operational emission thresholds for CO, VOC, NO_X, and PM_{10}. However, the Air Quality Impact Analysis, Appendix B of the Final EIR, separates the operational emissions by land use; therefore, the emissions associated specifically with the fuel station can be compared with the proposed Project. Based on the Project Trip Generation Analysis in the Traffic Scoping Agreement, the proposed Project would generate 826 daily trips, 52 daily trips more than the 774 trips anticipated for the gas station in the Final EIR.

Operational emissions associated with the Original Project and proposed Project are summarized in **Table 2: Operational-Related Emissions**. As shown in **Table 2**, the proposed Project's operational emissions are below MDAQMD's criteria pollutant thresholds. Although the proposed Project's emissions are below the MDAQMD's thresholds, operational emissions are slightly higher than the SO_X and PM_{10} emissions modeled for the fuel station in the Final EIR. This increase in emissions is likely the result of changing the models from the outdated URBEMIS model to the current version of CalEEMod, as the models calculate emissions differently. Although the proposed Project would generate 52 more daily trips than the Original Project, the emission rates for vehicles have decreased since the analysis for the EIR was conducted in 2006, due to regulatory requirements, technology improvements, and fleet turnover. However, the increase of these pollutants would not change the results when combined with the total emissions of the Original Project. As a result, impacts associated with the construction of the proposed Project would be less than significant and would not require any additional mitigation.

Table 2: Operational-Related Emissions						
Source	**Emissions (Pounds per Day)**					
	ROG	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Original Project[1]						
Total Original Project's Emissions	140	250	1,500	0.94	190	36

Proposed Project[3]						
Fuel Station Emissions	4.92	5.97	51.6	0.12	9.92	2.58
MDAQMD Threshold	*137*	*137*	*548*	*137*	*82*	*65*
Exceed MDAQMD Threshold?	**No**	**No**	**No**	**No**	**No**	**No**
ROG= reactive organic gases; NO_X = nitrogen oxides; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter 10 microns in diameter or less; $PM_{2.5}$ = particulate matter 2.5 microns in diameter or less; NA = data not available						
1. Original Project emissions are from Final EIR, Table 4.3.N, page 4.3-41. 2. Original Project fuel station emissions are from Air Quality Analysis, Appendix A URBEMIS 2002 Model Printouts, page 7, Mitigated Operational Emissions (Draft EIR Appendix B). 3. Emissions modeled with CalEEMod version 2022. Refer to Appendix A for model outputs.						

The Final EIR identified construction and operational exceedances of MDAQMD thresholds for criteria air pollutants and concluded that the Original Project would result in a significant and unavoidable impact. However, the proposed Project would not exceed any MDAQMD thresholds and therefore would result in a less than significant impact. The Final EIR identified Mitigation Measure 4.3.1A to reduce construction emissions of criteria pollutants, which would still be required as part of the EIR to reduce cumulative impacts.

Mitigation Program

The following applicable Mitigation Measure is identified in the Final EIR. No additional mitigation measures are required.

4.3.1A Prior to issuance of grading permits, the construction contractor shall provide evidence showing that the following measures shall be implemented to reduce NO_X and PM_{10} emissions from ground disturbance and VOC emissions from application of architectural coatings:

- The construction contractor shall select the construction equipment used on site based on low emission factors and high energy efficiency. The construction contractor shall ensure that construction grading plans include a statement that all

construction equipment will be tuned and maintained in accordance with the manufacturer's specifications.

- The construction contractor shall demonstrate to the Town that construction activities shall make use of alternatively fueled equipment or catalyst-equipped diesel powered equipment to the extent such alternative fuels are available.
- The construction contractor shall ensure that construction grading plans include a statement that work crews will shut off equipment when not in use.
- The construction contractor shall time the construction activities so as not to interfere with peak hour traffic and to minimize obstruction of through traffic lanes adjacent to the site; if necessary, a flagperson shall be retained to maintain safety adjacent to existing roadways.
- The construction contractor shall support and encourage ridesharing and transit incentives for the construction crew.
- The construction contractor shall demonstrate compliance with the fugitive dust suppression measures 403 a) through 403 e) contained in MDAQMD Rule 403.
- The construction contractor shall demonstrate compliance with the VOC suppression measures contained in MDAQMD 1113.
- The construction contractor shall apply non-toxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
- The construction contractor shall water active sites at least twice daily (Locations where grading is to occur shall be thoroughly watered prior to earthmoving).
- The construction contractor shall provide evidence to the Town that all trucks hauling dirt, sand, soil, or maintain at least two feet of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code (CVC) section 23114.
- The construction contractor shall pave construction access roads at least 100 feet onto the site from the main road.
- The construction contractor shall promote the reduction of traffic speeds on all unpaved roads to 15 miles per hour (mph) or less.

Conclusion

No new impact relative to air quality emissions evaluated in the Original Project Final EIR would occur with the development of the proposed Project. Although the Final EIR determined that the Original Project would result in a significant and unavoidable impact, improvements to equipment and engine efficiencies over time have reduced Project emissions to a less than significant level.

Threshold (c) Expose sensitive receptors to substantial pollutant concentrations.

The Final EIR determined that the exposure of sensitive receptors to harmful pollutant concentrations associated with the Original Project would be less than significant. The Final EIR analyzed CO emission hotspots from the vehicular traffic increase in local areas as well as diesel emissions from truck deliveries as a result of the Original Project.

The Final EIR studied 22 intersections in the project vicinity and determined that none of the studied intersections would exceed State standards. As shown in **Table 2**, CO emissions generated by the proposed Project would be lower than those modeled for the Original Project. Therefore, the development of proposed Project would not result in CO hotspots.

The Final EIR also determined that operational health risk impacts would be less than significant.[2] Typical Sources of carcinogenic and chronically hazardous toxic air contaminants (TACs) mostly include diesel particulate matter (DPM) from trucks and industrial manufacturing processes. As with the Original Project, the proposed Project would include delivery trucks which would generate DPM. The analysis for the Final EIR determined that emissions would not exceed the 10 in one million carcinogenic health risk threshold or the 1.0 chronic health index threshold.

Although it is not discussed in the Final EIR, TACs would also be generated by the fueling station component of the Original Project. Of the toxic compounds emitted from gasoline stations, benzene, ethylbenzene, and naphthalene have cancer toxicity values. However, benzene is the TAC which drives the risk, accounting for 87 percent of cancer risk from gasoline vapors and constitutes more than three to four times the weight of gasoline than ethylbenzene and naphthalene, respectively. Therefore, ethylbenzene and naphthalene have not been modeled and are instead considered significant in the case that benzene emissions are significant. Benzene emissions associated with the proposed Project were computed based on the maximum anticipated throughput of fuel (i.e., approximately 5.0 million gallons per year), used CARB emission factors for fuel dispensing facilities, and assumed that benzene makes up 0.46 percent of gasoline vapor.[3]

A Health Risk Assessment (HRA) was prepared separately for the proposed Project. The HRA determined that the health risk at the maximally exposed receptor, including DPM from construction equipment, DPM from truck deliveries during operations, and benzene emissions from the operation of the fuel station, would not exceed the cancer risk, chronic health risk, or acute health risk thresholds (refer to Yucca Valley Walmart Fuel Station - Health Risk Assessment).

Mitigation Program

None identified in the Final EIR. No additional mitigation measures are required.

Conclusion

No new impact relative to air quality emissions evaluated in the Original Project Final EIR would occur with the development of the proposed Project. Additionally, no new information of substantial importance that was not known and could not have been known at the time the Final EIR was certified is available that would alter the Final EIR's significance finding. This impact remains less than significant.

Threshold (d) Create objectionable odors affecting a substantial number of people.

The MDAQMD regulates odors through Rule 402 (Nuisance). Rule 402 prohibits the discharge from any source that cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. Typical land uses that generate odors include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding.

During construction-related activities, some odors (not substantial pollutant concentrations) that may be detected are those typical of construction vehicles (e.g. diesel exhaust from grading and construction equipment). These odors are a temporary short-term impact that is typical of construction projects and would disperse rapidly.

The Final EIR for the Original Project determined that odors associated with the Original Project would be less than significant. Consistent with the Original Project, the proposed Project would not include any of the land uses that have been identified by the MDAQMD as odor sources. Therefore, the Project would not create objectionable odors.

Mitigation Program

None identified in the Final EIR. No additional mitigation measures are required.

Conclusion

No new impact relative to air quality emissions evaluated in the Original Project Final EIR would occur with the development of the proposed Project. Additionally, no new information of substantial importance that was not known and could not have been known at the time the Final EIR was certified is available that would alter the Final EIR's significance finding. This impact remains less than significant.

GREENHOUSE GAS ANALYSIS

Previous Significance Determination: The Certified EIR analyzed GHG emissions from the Original Project for informational purposes only, as GHG emission analysis was not required by CEQA at that time and there was no quantifiable emission threshold.

The Final EIR used URBEMIS and calculated that the Original Project would generate 7,124 metric tons of carbon dioxide equivalent ($MTCO_2e$) per year. However, the fuel station component was not analyzed separately in the Final EIR. Therefore, for this analysis, GHG emissions for the fuel station from the Original Project were calculated using CalEEMod 2022 using emission rates from 2010, (although opening year was originally modeled as 2007, CalEEMod emission rates only go back to 2010. Using 2010 emissions would be conservative when calculating emissions because emission rates improve in future years due to improvements in engines and fuel efficiency, as a result 2010 emissions would be lower than 2007 emissions).

Using CalEEMod 2022 with 2010 emission rates, the fuel station from the Original Project was estimated to generate 2,351 $MTOC_2e$ per year during operation. However, as discussed earlier, MDAQMD did not have a GHG threshold at this time, therefore the analysis for the Final EIR was based on consistency with GHG reduction strategies that would reduce GHG emissions. These strategies should not be construed as mitigation as they are either existing standards required of all developments or are voluntary programs. The Final EIR acknowledges that although these strategies may reduce GHG emissions it was not possible at that time to quantify reductions in GHG emissions. However, the Original Project was found to be consistent with proposed reduction strategies. As a result, the Original Project's GHG emissions impact was found to be less than significant.

Proposed Project Analysis:

Threshold (e) Conflict with the emission reduction strategies contained in the California Climate Action Team's Report to the Governor.

Construction GHG Emissions

The proposed Project would result in direct emissions of CO_2, N_2O, and CH_4 from construction equipment and the transport of materials and construction workers to and from the project site. The GHG emissions would only occur during temporary construction activities and would cease once construction is complete. The total GHG emissions generated during the construction of the proposed Project are shown in **Table 3: Proposed Project – Construction Related Greenhouse Gas Emissions**. Construction GHG emissions are typically summed and

amortized over the lifetime of the project (assumed to be 30 years), then added to the operational emissions.[4]

Table 3: Proposed Project - Construction Related Greenhouse Gas Emissions	
Category	**$MTCO_2e$**
Total Construction Emissions	102.3
30-Year Amortized Construction	3.41
Source CalEEMod version 2022. Refer to **Appendix A** for model outputs.	

As shown in **Table 3**, the proposed Project would result in the generation of approximately 102.3 $MTCO_2e$ throughout the course of construction. The amortized Project construction emissions would be 3.41 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

Operational GHG Emissions

Operational emissions occur over the life of the Project. GHG emissions would result from direct emissions such as project-generated vehicular traffic including passenger automobiles and trucks, and from indirect sources such as off-site generation of electrical power, the energy required to convey water and wastewater to and from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators. GHG emissions associated with the Project are summarized in **Table 4: Proposed Project Operational Greenhouse Gas Emissions**. Construction GHG emissions have been amortized over a 30-year period and added to the total operational emissions of a project to ensure that GHG reduction strategies address construction emissions as part of the overall operation.

As shown in **Table 4**, the proposed Project would generate 1,960.29 $MTCO_2e$ of GHG emissions which is less than the 2,351 $MTCO_2e$ assumed for the fuel station component of the Original Project. As discussed previously, the Final EIR was prepared before MDAQMD had adopted the 100,000 short ton threshold (approximately 90,718 $MTCO_2e$). Instead, the Final EIR based GHG impacts based on consistency with GHG reduction strategies that would reduce GHG emissions. However, these GHG reduction strategies are now required under the California Air Resources Board (CARB) Scoping Plan. As a result, the proposed Project would be consistent with the original GHG reduction strategies and as shown in **Table 4**, would generate less emissions than both the Original Project and MDAQMD's current GHG threshold. Therefore, impacts related to GHG emissions would be less than significant.

[4] The project lifetime is based on the standard 30-year assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13, August 26, 2009).

Table 4: Proposed Project Operational Greenhouse Gas Emissions	
Source	**Emissions ($MTCO_2e$ per Year)[1]**
Proposed Project	
Construction Amortized Over 30 Years	3.41
Mobile Sources	1,886
Area Source	0.02
Energy	16.5
Water and Wastewater	0.17
Solid Waste	0.79
Refrigerants	53.4
Total	1,960.29
MDAQMD Threshold	90,718
Exceed MDAQMD Threshold?	**No**
1. Emissions modeled with CalEEMod version 2022. Refer to **Appendix A** for model outputs.	

Mitigation Program

None identified in the Final EIR. No additional mitigation measures are required.

Conclusion

No new impact relative to GHG emissions evaluated in the Original Project Final EIR would occur with the development of the proposed Project. Additionally, no new information of substantial importance that was not known and could not have been known at the time the Final EIR was certified is available that would alter the Final EIR's significance finding. This impact remains less than significant.

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.9	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.41	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	93.6
AQ-PM	0.92
AQ-DPM	2.80
Drinking Water	50.3
Lead Risk Housing	35.9
Pesticides	0.00
Toxic Releases	3.78
Traffic	11.0
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	4.42
Haz Waste Facilities/Generators	39.8
Impaired Water Bodies	0.00
Solid Waste	39.0
Sensitive Population	—
Asthma	61.8

Cardio-vascular	95.6
Low Birth Weights	63.3
Socioeconomic Factor Indicators	—
Education	26.4
Housing	57.4
Linguistic	7.38
Poverty	56.1
Unemployment	59.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	33.01680996
Employed	22.3662261
Median HI	26.52380341
Education	—
Bachelor's or higher	23.67509303
High school enrollment	14.38470422
Preschool enrollment	8.507635057
Transportation	—
Auto Access	60.64416784
Active commuting	29.26985756
Social	—
2-parent households	28.19196715
Voting	69.12613884
Neighborhood	—
Alcohol availability	82.54844091

Park access	10.6249198
Retail density	13.01167715
Supermarket access	27.64018991
Tree canopy	0.384960862
Housing	—
Homeownership	61.36276145
Housing habitability	67.11151033
Low-inc homeowner severe housing cost burden	37.71333248
Low-inc renter severe housing cost burden	53.27858334
Uncrowded housing	88.2586937
Health Outcomes	—
Insured adults	30.60438855
Arthritis	0.0
Asthma ER Admissions	34.7
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	5.2
Cognitively Disabled	15.9
Physically Disabled	28.8
Heart Attack ER Admissions	5.9
Mental Health Not Good	0.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	28.0
Healthy Places Index Score for Project Location (b)	25.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	default building square feet updated to 1,556 sq. feet to be consistent with Traffic Scoping Plan (November 2024). Landscape estimates based on January 2024 site plan
Operations: Vehicle Data	default trip rate changed to be consistent with Traffic Scoping Plan. 826 daily trips ÷ 6 pumps = 137.6667. default Weekday Primary Trip % changed to 100 percent because Traffic Scoping Plan daily trips already takes into account pass-by trips.
Construction: Construction Phases	default construction schedule was modified to be consistent with project specific construction schedule.
Construction: Dust From Material Movement	default values changed to be consistent with project specific data construction data.
Construction: Architectural Coatings	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.9	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.41	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	93.6
AQ-PM	0.92
AQ-DPM	2.80

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	28.0

Healthy Places Index Score for Project Location (b)	25.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	default building square feet updated to 1,556 sq. feet to be consistent with Traffic Scoping Plan (November 2024). Landscape estimates based on January 2024 site plan
Operations: Vehicle Data	default trip rate changed to be consistent with Original EIR. 774 daily trips ÷ 6 pumps = 129. default Weekday Primary Trip % changed to 100 percent
Construction: Construction Phases	default construction schedule was modified to be consistent with project specific construction schedule.
Construction: Dust From Material Movement	default values changed to be consistent with project specific data construction data.
Construction: Architectural Coatings	—

APPENDIX B, HEALTH RISK ASSESSMENT MEMORANDUM

This page intentionally left blank.

MEMORANDUM

To:	Town of Yucca Valley Planning Division
From:	Alex Pohlman, Kimley-Horn and Associates, Inc.
Date:	August 27, 2025
Subject:	Yucca Valley Walmart Fuel Station – Health Risk Assessment

1.0 Purpose

This comparative Health Risk Assessment (HRA) has been undertaken to analyze whether the proposed Yucca Valley Walmart Fuel Station Project (Project) would result in any new or substantially more severe significant health risks associated with Toxic Air Contaminants (TACs) as compared to the conclusions discussed in the certified Yucca Valley Retail Specific Plan (Original Project) Environmental Impact Report (Final EIR) that was certified on June 25, 2008. This technical memorandum evaluates the proposed updates associated with the Project, (described below) pursuant to Public Resources Code, Section 21166 or State CEQA Guidelines Section 15162. This HRA was prepared in accordance with the California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments* (February 2015).

2.0 Project Description

Original Project

The Final EIR for the Original Project analyzed the development of a commercial retail center on approximately 25.51 acres located on the southeast corner of Twentynine Palms Highway (SR-62) and Avalon Avenue. The EIR analysis for the Original Project included a 229,000-square foot Walmart Supercenter, a fuel station, a 4,000-square foot fast-food restaurant with drive-through, and a detention basin. However, the Specific Plan, approved on August 14, 2008, did not include the fuel station as a permitted use and the area designated in the EIR for the fuel station and a 4,000-square foot fast-food restaurant with drive-through was ultimately developed with two smaller fast-food restaurants instead.

Proposed Project

The proposed Project involves the development of a fuel station similar to the one previously analyzed in the Final EIR, although in a different location. The fuel station would be located in the northeastern portion of the existing parking lot, south of the detention basin and SR-62, see **Exhibit 1: Local Vicinity Map** and **Exhibit 2: Conceptual Site Plan**.

3.0 Regulatory Setting

Federal

Federal Clean Air Act

The Federal Clean Air Act (FCAA) was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as hazardous air pollutants (HAPs), and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the United States Environmental Protection Agency (U.S. EPA) issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and diesel particulate matter (DPM). More recently, the U.S. EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for NAAQS attainment and maintenance were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

FCAA Amendments Section 112 governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the general public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated

the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[1] The particulate matter (PM) emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also, the oxides of nitrogen (NO_X) and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010. In December 2022, the U.S. EPA final rule set new, more stringent standards to reduce NO_X pollution from heavy-duty vehicles and engines starting in model year 2027. The rule will reduce NO_X emissions from heavy-duty trucks by almost 50 percent by 2045, producing significant health-related benefits.[2]

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. The Tier 4 standards require that emissions of PM and NO_X be further reduced by about 90 percent from Tier 3 standards.

State of California

California Air Resources Board

CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions.

CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of

[2] United States Environmental Protection Agency (U.S. EPA), Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements, Final Rule. 40 Code of Federal Regulations, s 2, 59, 60, 80, 85, 86, 600, 1027, 1030, 1031, 1033, 1036, 1037, 1039, 1042, 1043, 1045, 1048, 1051, 1054, 1060, 1065, 1066, 1068, and 1090. January 24, 2023.

notices and public meetings. In September 1992, the AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. CARB is currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce NO_X and PM emissions from new, off-road compression-ignition (CI) engines, by an additional 50 percent to 90 percent, compared to what is allowed by today's Tier 4 final emission standards.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline.[3] CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[4] The DRRP includes regulations for cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce PM and NO_X emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks were required to be retrofitted with PM filters beginning January 1, 2012, and older trucks were required to be replaced starting January 1, 2015. Effective January 1, 2023, nearly all trucks and buses are required to have 2010 model year engines or equivalent.

The regulation applies to most privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

[3] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to DPM and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles including transportation refrigeration units (TRUs). The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools). On February 24, 2022, CARB approved amendments to the TRU ATCM (2022 Amendments) to achieve additional emission and health risk reductions from diesel-powered TRUs and increase the use of zero emission technology in the off-road sector. The 2022 Amendments will help meet the State's multiple risk reduction, air quality, and climate goals, as well as the directive of Executive Order N-29-20, which set a goal for 100 percent zero-emission off-road vehicles and equipment in the State by 2035.

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle and off-road idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

California Energy Commission – Title 24 Building Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings, as specified in California Code of Regulations (CCR) Title 24 Part 6, were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2022 Energy Standards include requirements for mandatory mechanical ventilation intended to improve indoor air quality in homes, and requirements for Minimum Efficiency Reporting Value (MERV) 13 air filtration on space conditioning systems, and ventilation systems that provide outside air to a dwelling's occupiable space. The Residential Compliance Manual for the 2022 Building Energy Efficiency Standards notes that air filter efficiencies of at least MERV 13 protect occupants from exposure to the smaller airborne particles (i.e., $PM_{2.5}$) that are known to adversely affect respiratory health. CCR Title 24 Part 6 requires a particle size efficiency rating equal to or greater than 50 percent in the 0.30 to 1.00 µm range and 85 percent in the 1.0 to 3.0 µm range.

CalEnviroScreen

OEHHA developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores. According to CalEnviroScreen, the Project Site is located within Census Tract 6071010412, which is within the 28nd overall percentile while the nearest sensitive receptors are located in Census Tract 6071010411 to the north and is within the 46th overall percentile.[5] It should be noted that the CalEnviroScreen scores are relative to other census tracts and are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others are required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, are required to report about their existing fleet operations. This information helps to identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

[5] OEHHA, CalEnviroScreen 4.0 Results (2022 Update), https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40, accessed December 2024.

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium- and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

CARB Advanced Clean Fleets Regulation

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requiring fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

Gasoline Dispensing Facility Vapor Recovery Regulations

Since 2001, CARB has adopted a number of significant enhancements to gasoline dispensing facilities' (GDFs') vapor recovery systems. These efforts are necessary to ensure the continued effective operation of the vapor recovery systems during the transfer and dispensing of gasoline at these facilities.

Vapor recovery systems collect gasoline vapors that would otherwise escape into the atmosphere during fuel delivery to the underground storage tanks (Phase I) or fuel storage and vehicle fueling (Phase II). The Enhanced Vapor Recovery (EVR) regulations became state law on April 1, 2001. These regulations provide more stringent requirements for vapor recovery systems in order to reduce gasoline vapor emissions.[6]

CARB Air Quality and Land Use Handbook – Gasoline Dispensing Facilities

The CARB *Air Quality and Land Use Handbook* (2005) recommends avoiding siting new sensitive land uses within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater).[7] A 50-foot separation is recommended for typical gas dispensing facilities. CARB

[6] The project would be required to comply with the State's Gasoline Dispensing Facility Vapor Recovery Regulations.
[7] The proposed Project would have a maximum anticipated throughput of approximately 5.0 million gallons per year.

notes that a typical gasoline dispensing facility in California dispenses under 3.6 million gallons of gasoline per year. The cancer risk for a typical facility is likely to be less than 10 in a million at the fence line under urban air dispersion conditions.

Gasoline Service Station Industrywide Risk Assessment Technical Guidance

CARB and the California Air Pollution Control Officers Association (CAPCOA) developed the 2021 Gasoline Service Station Industrywide Risk Assessment Technical Guidance Manual (Technical Guidance) based on health analyses conducted to evaluate the health impacts of emissions from gasoline service stations operating throughout the state. The Technical Guidance provides an update to the CAPCOA Air Toxics "Hot Spots" Program Gasoline Service Station Industrywide Risk Assessment Guidelines (1997). The Technical Guidance also provides recommended procedures for preparing gas station emission inventories and HRAs to meet the requirements of individual facilities subject to AB 2588.

Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document

CARB developed the 2022 *Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document* (Supplemental Policy Guidance or Guidance) to provide recommendations regarding public policy for gas stations and discuss potential community-scale health impacts caused by gas station emissions. In addition to discussing community-scale health impacts, the Supplemental Policy Guidance provides considerations and recommendations for the siting and permitting of new and modified gas stations. The Guidance also outlines the significant challenges in addressing cumulative impacts from multiple sources of gas stations and other sources.

Regional

Mojave Desert Air Quality Management District

The Mojave Desert Air Quality Management District (MDAQMD) has jurisdiction over the project site. The MDAQMD is the air pollution control agency for San Bernardino County's High Desert and Riverside County's Palo Verde Valley. It includes nearly 20,000 square miles and a population of more than 500,000; it is the second largest of California's 35 air districts by area. The MDAQMD has primary responsibility for controlling emissions from stationary sources of air pollution within its jurisdiction. This is accomplished in part by administering air quality programs required by federal and state mandates and enforcing rules and regulations based on air pollution law.

The MDAQMD is responsible for monitoring air quality and for planning, implementing, and enforcing programs designed to attain and maintain NAAQS and California Ambient Air Quality Standards (CAAQS) in their jurisdiction.

The MDAQMD has adopted rules to limit air emissions. Many of these rules were put in place as required measures specified in the various SIPs and air quality attainment plans.

4.0 Significance Criteria and Methodology

Risk Analysis Thresholds

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. The MDAQMD recommends that the following air pollution thresholds be used in determining whether the impacts from the Project are significant. If the Project has the potential to exceed the air pollution thresholds, the Project should be considered significant. The thresholds for air toxic emissions are as follows.

- **Excess (Incremental) Cancer Risk:** Emit contaminants that result in a maximum individual cancer risk (MICR) that equals or exceeds 10 in one million.
- **Non-Cancer Risk:** Emit contaminants that equal or exceed the maximum hazard index of 1.0 (project increment).

Cancer risk is expressed in terms of expected incremental incidence per million population. As noted above, the MDAQMD has established an incremental increase rate of less than 10 in one million as the maximum acceptable incremental cancer risk due to TAC exposure. This threshold is an upper-bound incremental probability to determine whether or not a given project has a potentially significant development-specific and cumulative impact and to ensure an individual new source does not contribute a cumulatively significant impact. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics.

The MDAQMD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0 means that adverse health effects are not expected.

Methodology

This HRA evaluates potential health risks associated with potential Project TAC emissions. Construction equipment and associated heavy-duty truck traffic generate DPM, which is a known TAC. DPM exhaust emissions from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Operational activities would also emit TACs from fueling and the use of heavy-duty diesel trucks.

Construction Sources

Construction would generate DPM emissions from the use of off-road diesel equipment required for demolition, grading and excavation, paving, and other construction activities. For construction

activity, DPM is the primary toxic air contaminant of concern because it is the most potent TAC emitted from construction and includes hundreds of chemicals. Although DPM is a subset of PM_{10} exhaust, the analysis conservatively assumes all PM_{10} exhaust emissions are DPM. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment were included in the analysis, although they are typically less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site potentially poses a health risk to nearby sensitive receptors. The nearest sensitive receptors are the residences located approximately 410 feet to the north, on the opposite side of SR-62.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the project site. Construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, §§2485 and 2449), which reduce DPM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. Idling limits would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, emissions of DPM would be generated from different locations on the project site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emission rates for PM_{10} (DPM) were calculated from the CalEEMod construction emissions modeling conducted for the project Air Quality and Greenhouse Gas Analysis. The duration of construction activities are anticipated to occur over an approximately 5-month period and the analysis assumes the earliest feasible start date (i.e., late 2025).[8]

Operational Sources

CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from DPM.[9] In addition, this HRA also evaluates potential health risks associated with the emission of benzene.

Of the toxic compounds emitted from the gasoline stations, benzene, ethylbenzene, and naphthalene have cancer toxicity values. However, benzene is the TAC which drives the risk, accounting for 87 percent of cancer risk from gasoline vapors and constitutes more than three to four times the weight of gasoline than ethylbenzene and naphthalene, respectively. Therefore,

[8] The earliest feasible construction start date has been modeled. Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover). Specifically, project construction was modeled to start in 2025. If construction commences at a later date, construction impacts would be less than those analyzed due to the use of more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase-in less polluting heavy-duty equipment. For emissions modeling purposes, conservatively analyzing the emissions using the earliest feasible construction start date (i.e., 2025), provides for a worst-case analysis and full disclosure of potential air quality impacts, as required by CEQA.

[9] California Air Resources Board, *Overview: Diesel Exhaust & Health*, https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed January 2025.

ethylbenzene and naphthalene have not been modeled and are instead considered significant in the case that benzene emissions are significant. Additionally, there are substances emitted from gasoline stations, such as toluene and xylene which possess acute adverse health effects (though not cancer risk). However, it is not until the benzene concentrations are more than two orders of magnitude above the 10 per million cancer risk threshold that the emissions of toluene and xylene begin to cause adverse health effects, according to the CAPCOA *Gasoline Service Station Industrywide Risk Assessment Guidelines*. Therefore, toluene and xylene emissions have not been modeled and are instead considered significant in the case that benzene concentrations are identified at two orders of magnitude above the 10 per million cancer risk threshold.

Fueling Sources

Benzene emissions would occur from the proposed on-site fuel storage tanks and fuel dispensers. The specific processes associated with fuel storage tanks and fuel dispensers that emit air toxics include loading, breathing, refueling, and spillage, as described below:

- Loading – Emissions occur when a fuel tanker truck unloads gasoline into the storage tanks. The storage tank vapors, displaced during loading, are emitted through its vent pipe. A required pressure/vacuum valve installed on the tank vent pipe significantly reduces these emissions.
- Breathing – Emissions occur through the storage tank vent pipe as a result of temperature and pressure changes in the tank vapor space.
- Refueling – Emissions occur during motor vehicle refueling when gasoline vapors escape through the vehicle/nozzle interface.
- Spillage – Emissions occur from evaporating gasoline that spills during vehicle refueling.

Fuel dispensing facility emissions were computed based on the maximum anticipated throughput of fuel (i.e., approximately 5.0 million gallons per year). Emissions of benzene, which is a TAC, were computed using CARB emission factors for fuel dispensing facilities and assuming that benzene makes up 0.46 percent of gasoline vapor.[10] Total benzene emissions were calculated at 0.0024 pounds per hour; refer to **Appendix A** for the details of these calculations. The emission factors conservatively do not reflect control technologies required by any vapor recovery regulations later than 2013 (such as Certification Procedure for Vapor Recovery Systems for Enhanced Conventional [ECO] Nozzles and Low Permeation Conventional Hoses for Use at Gasoline Dispensing Facilities [CP-207], Certification Procedure for Vapor Recovery Systems at Gasoline Dispensing Facilities [CP-201]). These emissions factors are currently being updated by CARB.

Mobile Sources

Due to the increased vehicle traffic from the Project, the resulting emissions could also result in pollutant concentrations at existing sensitive receptors. Two daily heavy-duty delivery truck trips

[10] *CAPCOA, Gasoline Service Station Industrywide Risk Assessment Technical Guidance,* January 2022.

were assumed to access the site and serve the fuel station. Emission rates in grams per hour for vehicle idling for PM_{10} (DPM) was calculated using trip data and CARB 2021 EMission FACtor model version 1.0.2 (EMFAC)[11] data for the Mojave Desert portion of San Bernardino County; refer to **Appendix A**.

The emissions rates were calculated using 2026 emissions factors since project construction would be completed in mid-2026. Truck emissions were conservatively based on the first possible year of operations for a fleet mix of various aged vehicles, as opposed to average emissions over a 30-year window. This approach is conservative as it assumes no cleaner technology in future years. Trucks were assumed to travel at a speed of 55 miles per hour (mph) on SR-62 and 15 mph in the Walmart parking area and on-site at the fueling station.

Dispersion Modeling

The on-site air dispersion modeling for the HRA was performed using the American Meteorological Society (AMS)/U.S. EPA Regulatory Model (AERMOD). AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources. AERMOD estimates hourly concentrations for each source/receptor pair and calculates concentrations for user-specified averaging times, including an average concentration for the complete simulation period. AERMOD includes atmospheric dispersion options for both urban and rural environments and can address flat, gently rolling, and complex terrain situations. The parameters used in AERMOD are detailed below.

- Meteorological Data. AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, atmospheric stability class, and mixing height. The latest 5-year meteorological data set from the Palm Springs International Airport Monitoring Station (KPSP), which is outside the MDAQMD area but is the closest station to the Project Site, was obtained from the South Coast Air Quality Management District (SCAQMD).[12] Surface and upper air meteorological data from this monitoring station was selected as being the most representative for meteorology based on proximity to the Project Site as well as terrain, surrounding land use and surface characteristics.
- Project Sources. The emissions sources were modeled in AERMOD. The following parameters were used for each source (refer to **Appendix A** for a depiction of the source and receptor locations):
    - Construction emissions sources were modeled as line volume sources (comprised of smaller adjacent volume sources) for on-site construction and off-site haul truck operations. Off-road construction equipment operating on-site were assigned a

[11] California Air Resources Board, *EMFAC 2021 Web Database,* https://arb.ca.gov/emfac/ accessed December 2024.
[12] South Coast Air Quality Management District, *Health Risk Assessment Tool and AEROD-Ready Meteorological Data Files*, https://www.aqmd.gov/assets/aermet/AERMET_files_And_HRA_Tool.html, accessed December 2024.

release height of 12.5 feet (3.82 meters) and a plume height of 25.1 feet (7.6 meters) based on a vehicle height of 14.7 feet (4.5 meters).[13] On-road construction equipment (hauling materials to and from the Project site) were assigned a release height of 10.3 feet (3.15 meters) and a plume height of 20.6 feet (6.29 meters) based on a vehicle height of 12.1 feet (3.7 meters).

- Operational mobile emission sources were modeled as line volume sources truck operations. Heavy duty vehicle emissions were assigned a release height of 10.3 feet (3.15 meters) and a plume height of 20.6 feet (6.29 meters).
- Operational fueling sources were modeled as a combination of volume and point sources.[14] Loading and breathing sources were modeled as point sources with a release height of 3.66 meters. Building downwash[15] was applied for the loading and breathing sources. Fueling and hose permeation were modeled as volume sources with a release height of 1.5 meters. Spillage was modeled as a volume source with a release height of 1 meter. Fueling sources were assumed to operate 24 hours a day.

- Receptor Grid. To identify the maximum impacted receptors, discrete placed on the nearest sensitive receptors and a uniform 20-meter Cartesian grid was placed over other locations within 1,000 feet of proposed Project's perimeter.
- Terrain Characteristics. The United States Geological Survey (USGS) National Elevation Dataset (NED) terrain data was imported into AERMOD. AERMOD regulatory defaults, the "Urban" modeling option for the County, and "Elevated" terrain were used for this analysis.
- Averaging Times. AERMOD was run to obtain the peak 1-hour and annual average (period) concentration in micrograms per cubic meter ($\mu g/m^3$) of PM_{10} and TOG at receptors (i.e., residents and businesses).

AERMOD was used to estimate (a) annual average concentrations to calculate the Maximum Individual Cancer Risk (MICR), the maximum chronic HI, and the zones of impact, and (b) peak hourly concentrations to calculate the health impact from substances with acute non-cancer health effects. Note that the concentration estimate developed using this methodology is conservative and is not a specific prediction of the actual concentrations that would occur at the Project Site at any one point in time, which would likely be lower. Actual pollutant concentrations are dependent on many variables, particularly the number and type of vehicles operating at specific distances during time periods of adverse meteorology.

Risk and Hazard Assessment

---

[13] The Haul Road Volume Source Calculator in AERMOD was used to determine the release height and plume height based on the average height of vehicles and equipment modeled.

[14] California Air Resources Board, *Gasoline Service Station Industrywide Risk Assessment Technical Guidance*, February 18, 2022

[15] Building downwash is applied to point sources in AERMOD to account for the potential for pollutants to be trapped in a recirculating pattern near buildings

Cancer Risk

Based on the OEHHA methodology, residential inhalation cancer risk from annual average DPM and benzene concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Dose-air = dose through inhalation (mg/kg/day)
C_{air} = air concentration (µg/m^3) from air dispersion model
(BR/BW) = daily breathing rate normalized to body weight (L/kg bodyweight-day)
A = inhalation absorption factor (unitless)
EF = exposure frequency (approximately 350 days per year for residential)
10^{-6} = conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends default ASFs presented in **Table 1: Exposure Assumptions**. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home.

Table 1: Exposure Assumptions

Age	Exposure Frequency (days/year)[1]	Exposure Duration (years)[2]	Age Sensitivity Factor (ASF)[3]	Fraction of Time at Home (FAH)[4]	Daily Breathing Rate (L/kg BW-day)[5]
Residential Exposure					
Third trimester	350	0.25	10	85%	361
0 to 2 years	350	2	10	85%	1,090
Ages 2 through 9 years	350	7	3	72%	631
Ages 9 through 16 years	350	7	3	72%	572
Ages 16 and greater	350	13.75	1	73%	261

1. The exposure frequency is based on OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015 (OEHHA Manual); refer to OEHHA Manual Section 5.4.1, Estimation of Exposure through Inhalation.
2. The exposure duration is based on the OEHHA Manual) refer to OEHHA Manual Equation 8.2.4 A.
3. The age sensitivity factor is based on OEHHA Manual Table 8.3, *Age Sensitivity Factors by Age Group for Cancer Risk Assessment*.
4. The fraction of time at home is based on OEHHA Manual Section 8.2.2, *Fraction of Time Spent at Home for Cancer Risk Assessment*.
5. Daily breathing rate normalized to body weight (L/kg body weight – day) (95th percentile for 3rd trimester to 2 years and 80th percentile for other age groups) per OEHHA Manual Table 5.7, *Daily Breathing Rate Distributions by Age Group for Residential Stochastic Analysis (L/kg BW-day)*.

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air}*CPF*ASF*(ED/AT)*FAH)$$

$Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ = daily dose through inhalation (mg/kg-day)
CPF = inhalation cancer potency factor (mg/kg-day^{-1})
ASF = age sensitivity factor for a specified age group (unitless)
ED = exposure duration (years)
AT = averaging time of lifetime cancer risk (years)
FAH = fraction of time spent at home (unitless)

Chronic Non-Cancer Risk

Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The following equation was used to determine the non-cancer risk:

$$Hazard\ Index = C_i/REL_i$$

C_i = concentration in the air of substance i (annual average concentration in µg/m^3)
REL_i = chronic noncancer Reference Exposure Level for substance (µg/m^3)

Acute Non-Cancer Hazard

The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. The equation is as follows:

$$Acute\ HQ = Maximum\ Hourly\ Air\ Concentration\ (\mu g/m^3) / Acute\ REL\ (\mu g/m^3)$$

Health Risk Computation

A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 30-year exposure scenario and the daily breathing rates, age sensitivity factors, exposure duration, and fraction of time at home specified in the OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments* (February 2015). Health risks were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer health risks to an individual as well as the non-cancer chronic health index.

The off-site impacts would occur from the diesel trucks accessing the proposed Project. The cancer and chronic health risks are based on the annual average concentration of PM_{10} (used as a proxy for DPM). As noted above, the chronic and carcinogenic health risk calculations are based on the

standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual (2015).

5.0 Potential Health Risk Impacts

Previous Significance Determination

The Final EIR determined that operational health risk impacts would be less than significant. Typical Sources of carcinogenic and chronically hazardous TACs mostly include DPM from delivery trucks. The Final EIR reported carcinogenic and chronic health risks for the Original Project based on the distance of sensitive receptors from the Original Project boundary[16] and does not separate the emissions from the fueling station. The Final EIR showed that carcinogenic health risk for residences 15 meters (49 feet) from truck activity areas would be 0.63 in one million, while residences 100 meters (328 feet) from truck activity areas would be 0.23 in one million, both of which are below the carcinogenic threshold of 10 in one million. The Final EIR also reported the chronic health risk as 0.00039 for residences 15 meters from truck activity areas and 0.00015 for residences 100 meters from truck activity areas, both are below the 1.0 chronic health index. As a result, the Final EIR determined that the Original Project would not result in any significant health impacts and no mitigation was required.

Proposed Project Analysis

Threshold (a) Expose sensitive receptors to substantial pollutant concentrations.

As with the Original Project, the proposed Project would include fuel delivery trucks which would generate DPM. However, this analysis also includes DPM emissions from construction equipment used during construction of the proposed Project, and TAC (benzene) emissions from the operation of the fueling station which were not included in the Final EIR analysis.

Cancer Risk

As noted above, based on the CARB *Air Quality and Land Use Handbook*, the Project would be considered a large gasoline dispensing facility with a fuel throughput of greater than 3.6 million gallons per year (the Project is anticipated to have a throughput of approximately 5 million gallons per year). Additionally, the dispensing facility would be located more than 300 feet from the property line adjacent to residential land uses and is expected to produce a risk of less than 10 according to the CAPCOA Gasoline Service Station Industry-wide Risk Assessment Guidelines.

The Project would be required to install vapor recovery systems per CARB's ATCM, comply with CARB's Vapor Recovery System Certification Procedure, and Use Enhanced Conventional (ECO) and Enhanced ORVR-Vehicle Recognition (EOR) nozzles, among others. The Project would also be

[16] Final EIR Yucca Valley Retail Specific Plan, 2008 Table 4.3.I, page 4.3-34.

required to comply with MDAQMD Rule 201 (Permit to Construct), Rule 203 (Permit to Operate), and Rule 461 (Gasoline Transfer and Dispensing). These regulations are required to reduce fuel station emissions.

Table 2: Risk Assessment Results shows that carcinogenic risk resulting from the proposed Project would not exceed the 10 in one million threshold. The calculations conservatively assume no cleaner technology with lower emissions in future years. **Table 2** shows that at the maximally exposed receptor, construction risk would be 0.15 in one million and operational risk would be 0.393 in one million. Worst-case worker exposure would also not exceed the 10 in one million threshold. Therefore, carcinogenic hazards are calculated to be within acceptable limits and impacts would be less than significant.

Table 2: Risk Assessment Results

Receptors	Cancer Risk (per million)[1, 2, 3]				
	Construction	Operations			Construction and Operations Combined
		Trucks	Fuel Station	Total Operations	
Residences					
Approximately 440 feet northeast	*0.13*	*0.003*	*0.39*	*0.393*	*0.523*
Approximately 462 feet northwest	0.15	0.002	0.34	0.342	0.492
Significance Threshold (Risk per Million)	*10*	*10*	*10*	*10*	*10*
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**
Worker Exposure					
Approximately 118 feet east	0.09	*0.003*	0.80	0.803	0.893
Significance Threshold (Risk per Million)	*10*	*10*	*10*	*10*	*10*
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**

1. The reported risk is at the closest receptor (maximally exposed individual receptor (MEIR)) for each exposure category.
2. Risk from construction and trucks is from PM_{10} and risk from the Gas Dispensing Facility is benzene.
3. The maximum cancer risk is based on worst-case exposure durations for the Project, 95th percentile breathing rates for less than two years old and 80th percentile for two years old and greater, and 30-, 25-, and 9-year averaging time for residences, workers, and students, respectively.

Refer to **Appendix A: HRA Modeling Data**.

Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts.

RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[17] There is no acute REL for DPM and the acute health risk cannot be calculated. The chronic and acute REL for benzene is 3 and 27 respectively, and the target organ is the hematologic system.

Acute and chronic impacts are shown in **Table 3: Chronic and Acute Hazard Assessment Results**. An acute or chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the acute or chronic exposure by the reference exposure level. **Table 3** shows that non-carcinogenic hazards are calculated to be within acceptable limits and a less than significant impact would occur.

Table 3: Chronic and Acute Hazards Assessment Results

Emissions Sources	Chronic Hazard	Acute Hazard
Residential Receptors		
Construction	0.000256	N/A
Trucks	0.000001	N/A

Threshold	*1.0*	*1.0*
Threshold Exceeded?	**No**	**No**

N/A = not applicable, acute health risk for DPM cannot be calculated
Refer to **Appendix A: HRA Modeling Data**.

Mitigation Program

None identified in the Final EIR. No additional mitigation measures are required.

Conclusion

No new impacts relative to carcinogenic health risk or non-carcinogenic hazards evaluated in the Original Project Final EIR would occur with the development of the proposed Project. As described above, the proposed Project's carcinogenic risk would not exceed the MDAQMD's threshold of 10 in one million and non-carcinogenic hazards are also below the acceptable limits. It should be noted that the Final EIR did not analyze TAC emissions associated with the fueling station. However, consistent with the CARB *Gasoline Service Station Industrywide Risk Assessment Technical*

[17] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary. Accessed December 2024.

Guidance Manual and *Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document,* these emissions have been included in this health risk analysis. As noted previously, even with these additional sources of TACs the health risk remains below MDAQMD's thresholds.

There are no new potentially significant impacts associated with development of the proposed Project; therefore, no mitigation measures are required. Additionally, no new information of substantial importance that was not known and could not have been known at the time the Final EIR was certified is available that would alter the Final EIR's significance finding.

          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   125.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Yucca_Walmart_Const_Revised.err

 **File for Summary of Results:   Yucca_Walmart_Const_Revised.sum

- - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10
```

```
 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     42 Source(s);       4 Source Group(s); and     980
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     42 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   125.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.8 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Yucca_Walmart_Deliver_Revised.err

 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
```

```
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: TOG

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     14 Source(s);       5 Source Group(s); and     980
Receptor(s)

                with:      2 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     12 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   125.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3
```

```
 **Approximate Storage Requirements of Model =      3.8 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Yucca_Walmart_Fuel_Revised.err

 **File for Summary of Results:   Yucca_Walmart_Fuel_Revised.sum
